

TI's Home Computer. Unbeatable value. Unrivalled software.

When you choose a TI Home Computer you're choosing a "real" computer. A computer that can grow with you and your family. A computer that lets you play, invent, discover... that lets your imagination soar.

What makes this possible is our wide range of software. You'll find subjects as simple as "Early Reading" and as complex as "TMS 9900 Assembler Editor." Many of our programs are packaged in our unique Solid State SoftwareTM Command Modules. Some have sound. Others have superb colour graphics. Simply plug them in and begin.

When you want to learn to

program for yourself, the TI 99/4A is ready too. TI BASIC is built in. The programming manual is easy to understand, easy to follow every step of the way. You will be amazed

6U

"Have you finished your homework yet?". It is half past eight as Mrs Smith calls up to her son for the fifth time that evening. As soon as he arrives home from school, he shuts himself away in his room which flickers blue as his ZX-81 sluggishly accepts lines of Basic. Still, she reassures herself, he will soon grow out of it. Last year it was Rubik's cube; next year it will be something different. It is just another one of his fads.

But is home computing just another fad? It is impossible to say exactly how many of the half million ZX-81s sold world-wide are already gathering dust beside the skateboards and Kung Fu magazines. But what is clear is that falling prices have turned home computers into disposable consumer products. If your foray into computing has cost you only £50, you can abandon it with greater equanamity than if you had spent £300.

Nevertheless the parallel between the home computer and the likes of the Hoolahoop breaks down because the micro represents the domestic face of a technology which will pervade our society for many years to come. Unfortunately the aspect of computing which, month after month, will continue to be subject to the whims of fashion is exactly what you use your machine for. We have already seen Pac-Man succeed Space Invaders as the vogue game, in the same way that Space Invaders pushed out the ball and paddle games before it. The original spur for many who decided to buy a computer was that they could save their money from the insatiable appetites of arcade machines by playing the games at home on their own micros. Consequently this has meant that the investment behind the development of the latest arcade games forces home-computer software houses to follow in their path.

Only when new applications are designed specifically to take advantage of the micro's facilities will they be able to cast off their role of dedicated followers of the fashions of other and sometimes older technologies and applications. Once software suppliers overcome the limitations of existing computer languages and, more importantly, start using their imaginations the home computer will come into its own. If this is done home computing may still be a fad but it should be good at least to the end of the century.

ATARI PRICES REDUCED

We at Silica Shop are pleased to announce some fantastic reductions in the prices of the Atari 400'800 personal computers. We believe that the Atari at its new price will become the U.K.'s most popular personal computer and have therefore set up the Silica Atari Users Club. This club already has a library of over 500 programs and with your purchase of a 400 or 800 computer we will give you the first 100 free of charge. There are also over 350 professionally writcharge. There are also over 350 professionally writ-ten games and utility programs, some are listed below. Complete the reply coupon and we'll send you full details. Alternatively give us a ring on 01-301 1111 or 01-309 1111.

Jupiter ACF

"The Ace is an excellent way of using FORTH"

Popular Computing Weekly

"FORTH is an easy language" Byte The Jupiter Ace personal computer runs in FORTH, an easily understood language, typically four times as compact and ten times as fast as BASIC. Before the Ace all personal computers used BASIC and FORTH was only available to a privileged few.

The Jupiter Ace also features a full-size moving-key keyboard, high-resolution graphics, sound, floating point arithmetic, a fast and reliable cassette interface and 3K of RAM.

If you own a personal computer you will be aware of the limitations of BASIC. You know how slowly your programs run and how quickly your computer's memory gets filled. The Jupiter Ace is your answer.

If you already know FORTH, the Jupiter Ace closely follows the FORTH 79 standard with extensions for floating point, sound and cassette. It has a unique and remarkable editor that allows you to list and alter words that have been previously compiled into the dictionary. This avoids the need to store screens of source, allowing the dictionary itself to be saved on cassette. Comprehensive error checking removes the worry of accidentally crashing your programs.

All inclusive price

For £89.95 you receive your Jupiter Ace, a mains adaptor, all the leads needed to connect to most cassette recorders and T.V.s (colour or black and white), a software catalogue and a manual.

The manual is a complete introduction to the world of personal computing and a course in FORTH programming on the Ace.

Even if you are a complete newcomer to computers, the manual will guide you step by step from first principles to confident programming.

The price includes postage, packing and V.A.T.

The Jupiter Ace is backed by a full 12 month warranty.

Available soon

Plug-on parallel printer interface.

For around £20.00 this will connect your Jupiter Ace to anything from high-speed dot matrix to letter-quality daisy wheel printers.

Plug-on 16K Memory Expansion

For around £30.00 you will increase the memory of your Jupiter Ace to 19K giving you instant access to enormous amounts of information.

Software

A catalogue will be sent with every machine, and includes, initially, programs for education and entertainment.

FORTH Finishes First!

Speed Comparison Chart showing times in seconds to perform one thousand operations.

Type of Operation	Jupiter Ace	BBC Micro	Vic 20	Spectrum	ZX81
Empty loop	0.12	0.67	1.3	4.2	17.7
Print a number	7.5	13.5	26	19	430
Print a character	0.62	1.3	3.1	7.5	24
Add two numbers	0.45	1.4	5.5	7.5	28
Multiply two numbers	0.9	1.6	6.5	7.5	32

Because of the difficulty in devising exactly equivalent programs, these measurements should only be taken as a guide.

only £89.95

Designed by Jupiter Cantab

Computer Designers Steven Vickers and Richard Altwasser played a major role in creating the ZX Spectrum and then formed Jupiter Cantab to develop advanced ideas in personal computing. The Ace is the result, another all-British computer to lead the world.

Technical Information

Z80A running at 3.25 MHz. 8K bytes ROM

3K bytes RAM

Keyboard

40 Moving-key keyboard with auto repeat on every key and

Screen

Memory mapped 32 column x 24 line flicker-free display with upper and lower case ascii character set.

Graphics

Chunky graphics (64 x 46 pixels) may be plotted, unplotted or over-plotted (XOR operation). Also, the entire character set (128 characters and their video inverses) may be redefined allowing intricate shapes to be drawn with a resolution equivalent to 256 x 192 pixels.

Control Structures

IF-ELSE-THEN, DO-LOOP DO-+LOOP, BEGIN-WHILE-REPEAT, BEGIN-UNTIL, all may be mixed and nested to any

Programming in FORTH

STARS

parenthesis and have no action.

Programming in FORTH

FORTH programs are constructed without linenumbers, as words which are defined in terms of other

100 mSecs)

(: starts word definition) (print 3 asterisks)

words that already exist. Consider the following

definition of the word STARS. Comments are in

Programs and data in the compact dictionary format may be saved, verified, loaded and merged. Blocks of memory can be saved, verified, loaded and relocated. All tape files are named. Running at 1500 baud, the Ace will connect to most portable tape recorders.

Expansion Port

Contains D.C. power rails and full Z80 Address, data and control signals. May be used to connect extra memory and other peripherals. IN and OUT words allow port-based peripherals to be addressed.

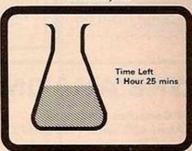

Data Structures

Integer, Floating point and String data may be held as constants, variables or arrays with multiple dimensions and mixed data types. There are no restrictions on names.

Sound

Internal loudspeaker may be programmed to operate over the entire audio

In Schools Teachers already know how quickly children take to computing, and the Jupiter Ace is an ideal introduction. FORTH is an easy and important language to learn and by making learning fun, the Ace can help to teach science, music and many other subjects.

In Laboratories For monitoring and controlling experiments, the Jupiter Ace has many advantages. The language is perfect, even the Jodrell Bank Radio Telescope is controlled in FORTH. The Ace expansion port enables it to be interfaced to almost anything, and the built in quartz timer allows experiments to run all weekend.

"FORTH is very flexible' "FORTH is compact"

Electronics and computing

"FORTH is in general very much faster than BASIC"

Computing Today

At Home The Jupiter Ace is powerful enough to play games as complex a and with sound and high resolution graphics, action games written in FORTH will stretch your reaction speeds to their

FMAMJJASON

In the Office Stock control, Accounts and Financial forecasts are all possible on the Jupiter Ace. With a printer and extra memory attached you can do word processing as well.

ORDER NOW!

STARS the computer will print out 3 asterisks and sound a short tone. (Notice how the word BEEP comes after the numbers it uses, 200 and 100. This characteristic occurs throughout FORTH so that you write, for instance, 28 76 + instead of 28 + 76.)

200 100 BEEP (play a note for

The semi colon at the end finishes the word definition. Now, whenever you say

The Jupiter Ace already has 140 FORTH words defined in ROM.

The Jupiter Ace is available only by mail order. Please allow up to 28 days for delivery.

Send cheque or postal order with the form to:-JUPITER CANTAB, 22 FOXHOLLOW, BAR HILL, CAMBRIDGE CB3 8EP

ANSOFT

ANNOUNCE

A NEW RANGE OF ZX81 AND SPECTRUM SOFTWARE PRODUCTS FOR THE DISCERNING USER

Amersham Software Ltd exists to provide software for those users who wish to develop the full potential of their ZX81 and Spectrum computers in the simplest and most effective way, without costly and unreliable hardware changes.

All AMSOFT products are designed to work using standard Sinclair equipment, but can be used to generate software for any other devices as well. The range will include assemblers, relocating loaders, compilers, etc. running under a standard monitor system, as well as file handling software to allow Basic users to handle data files.

The first two products are available now:

AM-ZXMON a superb machine code Monitor for the ZX81 allows entry, alteration, movement, verification and execution of machine code programs. The contents of any location or block of locations can be displayed on the screen or printer and user programs can contain breakpoints which allow examination or alteration of the Z80 registers and memory. A special feature allows individual program sections to be saved and loaded on cassettes, and merged together, providing machine code software library facilities. All AMSOFT compilers, etc. will be compatible with AM-ZXMON.

Superb value at £5.75 inc. VAT

AM-ZXFILE allows the Basic user to create and read back data files to and from cassettes. Users can specify the number of records per block written, the block sizes, and the length of the interblock gaps. Records can be fixed or variable in length and are created in or transferred to a Basic string array.

Provides the facilities of a large machine at £3.50 inc. VAT

SWISS HELP

uch has been written about problems met by ZX-81 owners during loading and saving programs. I learned the following three rules the hard way, after trouble-free loading since August 1981:

First, if the cassette recorder can run on batteries as well as the main supply, remove the batteries when loading/saving with the mains electric supply. The batteries cause the signal to be very blunt and the ZX does not accept them.

Second, never store your cassettes too near the TV set - the TV set has a magnet in it!

Third, use a cassette-tape headcleaner regularly. I very nearly lost my favourite game because of a dirty tape head. The signal gets distorted and is incorrectly transmitted.

I must thank your contributors: C J Young for his fantastic Assault Craft, June 82, Julian Stradling for his addictive Patience, August 82 my favourite game almost lost - and your third contributor on my list Garry Owens for his very clever Landscape, September 82. Your magazine gives me immense pleasure, and I shall definitely renew my order next Spring, whether my Spectrum, ordered by a pal in England in June, is here or not.

Mrs Dane Kurth-Rowe, Busswil. Switzerland.

6502 ERRORS

he listing of my 6502 assembler in Your Computer September issue contained three errors. The following lines should read: 50 IF LEFT\$ (C\$ (F),1) = "B"AND LEFT\$ (C\$(F),3) <> "BIT" THEN ... etc. 2540 IF LEFT\$(A\$(A),1) = "B"AND LEFT\$ (A\$(A), 3)<>"BIT" THEN ... etc. 2500 IF D2 > = 65535 THEN GOSUB 720: GOTO 1440

I would also like to point out that other commands can easily be added to the assembler in the routine from line 1410 to line 1640 - for example a routine could be added to verify tape saves.

Philip Horton, Evesham, Worcestershire.

DISGRUNTLED

wo things annoy me: the attitude of schools to the computer they choose, and letters to Your Computer from owners of Atom or BBC machines.

First the educational authorities' attitude. Where is the logic in buying a machine such as the Pet at around £350 when several cheaper machines could be bought for the same price? It is obvious that the Pet is superior to, say, the ZX-18, But the idea of computers in schools is to enable as many pupils as possible to learn something about computers and programming.

Regrettably the education authorities will still plump for machines such as the Pet merely because they are dearer. The reason for this is simply that the schools are given a grant for items and if the grant isn't spent in one year, then next year the estimate of the grant is reduced. The simplest, and best, way for the pupils, is to allow schools to spend the grant on more than one machine.

The superior attitude of Atom and BBC owners would appear to be based on the fact that they have purchased an expensive machine. But these machines have a nonstandard language which is therefore of little use as far as learning to program is concerned. Whilst admitting that Atom Basic is very fast, it is still too slow for Space Invader games.

G A Bobker. Bury, Lancashire.

ZX SNATCHER

wonder low long Mrs Thatcher had to wait for the Spectrum that she gave to the Japanese. I ordered mine at the end of May, and still there is no expected delivery date put on my order. So, at least in my case, Mr Sinclair cannot even fulfill his promise of delivery 12 weeks after receipt of the confirmation of the order. With the prevailing sellers' market, roll on a serious competitor to Sinclair Research Ltd.

I hope Mrs Thatcher did not receive the computer intended for

> Gordon Scott, Sheffield.

SAVING GRACE

hen programs are to be Saved with new or changed data after operation, on ZX-81s this routine is useful. In the example, the Saving part of the program takes place at Lines 190 to 210. Line 2 can be typed in as it reads - no Loader routine is required in this case:

01 GOTO VAL "100"

02 REM 11625258550040525053585742 551100453856005152570053384641 005042004352550050620055525857 465142560053583949465645424100 465100000000115652435760385542 0 0434649422711TAN

100 SLOW

110 FOR J = 1 TO 159 STEP 2

120 LET K = USR 16686

130 LET X\$ = CHR\$ PEEK (16525 + J) + CHR\$ PEEK (16526+J)

140 PRINT CHR\$ VALX\$:

150 NEXT J

160 PRINT ...

170 IF INKEY\$ = "" THEN GOTO 170

180 REM SAVE PROGRAM

190 LET X\$='

200 IF INKEY\$ = "S"THEN INPUT X\$ 210 IF X\$>"" THEN SAVE X\$ 220 IF INKEY\$ = " STOP " THEN

To Save, when the program is running, press key S. This gives a string input, into which a program name is entered. The tape recorder should then be turned on before Newline is pressed. Note that, in this case, pressing Stop will Stop the program, and any other Control Lines can be written in after Line

> Nick Godwin, Eyemouth, Berwickshire.

BBC FREEZE

n my opinion one of the most useful facilities on the BBC Micro is that while scanning through a listing, it is possible to freeze the screen by holding down Ctrl & Shift at the same time. The screen will stay in the same position as long as the keys are depressed, and Scrolling will continue when they are let go. The other tip is concerning a fault in the BBC machine. A command word like List, or New cannot be put into a program line, so:

100 LIST

would give a Syntax Error message. There is, however, a way of getting round this, which is as follows: 100 ON ERROR LIST

110 ERROR

This method can also be used for

David Machin, Longton, Stoke-on-Trent.

ATARI IDEAS

t was interesting to see Graphic recall for the Atari in Your Computer's October issue, page 93; but it requires more explanation.

First, the program as printed does not draw a rectangle, it draws two straight lines. The listing here does draw a rectangle:

10 GRAPHICS 8

15 SETCOLOR 2,2,2:COLOR 1

20 PLOT 20,20:DRAWTO 200,20: DRAWTO 200, 150: DRAWTO

20.150:DRAWTO 20.20

Note that I have added a Setcolor command to provide a red background. The Color 1 instruction in the original program could be deleted. In Atari Basic, there's no point in using a Color command unless you already have a Setcolor command.

Typing Graphics 1000 does indeed reveal the disappeared rectangle, though more by accident than design.

The Atari uses a Graphics instruction from 0 to 11 to set the Screen Mode - colours available and resolution. In Modes 0 to 8 inclusive the straightforward Graphics command leaves a four line text window at the bottom of the screen. Adding 16 to the graphics command removes this window. The command could be issued as GR.8+16, or as GR.24.

Now, adding 32 to the graphics command removes the text window but also protects the Screen RAM, where the image is stored, so that it is just refreshed. Thus to get the effect noticed by Tony Gillett, you just need to use GR.8+32.

With regard to the comments about Get, some readers may be confused by Com, which Tony Gillett uses in his Line, but this only means Dim, which is the preferred word. In Atari Basic, Get always returns a numeric value. However, it is not necessary to assign the value to a string if a letter is required: Print CHR\$(A) will often do. For example:

10 OPEN # 1,4,0,"K:":GET # 1,A:PRINT CHR\$(A):CLOSE

Goodness knows why anyone would want to do this.

However, it is interesting to find someone who can tear himself away from the world's best computer game, Star Raiders, for long enough to look at Atari Basic. Maybe some more readers will now send in their

> Jack Schofield, Sutton, Surrey.

REASSEMBLE

here are four mistakes in the YC October Spectrum assembler tables. The corrections are as follows:

Line 1801: 15th item along was: "D=M": this should be "D@M": 38th item along was "7HG" this should read "7HJ".

Line 1804: last item was "07L" should be "0L7"

Line 1805: 20th item along was "7XD": should be "HXD".

Chris Lam, Redhill, Surrey.

SMALL PRINT

have a little advice for your readers to do with software adverts, after having been taken for a ride by a software house.

I ordered three games but got back two totally different programs. I sent the packages back two months ago and have only just got my money back, after many phone calls and

My first piece of advice is read the advert thoroughly, especially small print - for example, add 50p for postage and packing and 15 percent. for VAT. Second, always ring the company concerned before ordering the program, making sure the software is still available and not out of circulation. Finally, ask if there is a money-back guarantee.

Mark Wilkinson, Brighouse, Yorkshire.

Home doctor needs Vic

EASTMEAD COMPUTER Systems has released six cassettes in a Home Doctor series. Each cassette contains 18 programs which give advice on a variety of symptons and health topics. Diagnosis is given on most complaints. The list of topics leads off with abdominal pains, alcoholism, backache and bad breath.

The content of these programs has been prepared by Dr Vernon Coleman, author of a number of books on home medicine.

The cassettes cost £6.75 each or £33.95 for all six. They are available by mail order for the Vic-20 and ZX-81 from Eastmead Computer Systems Ltd, Eastmead House, Lyon Way, Camberley, Surrey GU16 5E2.

Fast Spectrum 16K compiler

SOFTEK'S COMPILER for the 48K Spectrum enables Basic programs to run up to 10 times faster than normal. In contrast to the standard Basic interpreter which converts Basic to machine code while a program is running, a compiler produces a machine code version of a program prior to run time.

The compiler takes up around 16K at the top of RAM. The present version can cope with about 80 percent of Spectrum Basic commands. Compiled code is not quite as efficient as tailor-made machine code.

The program is available from Softek, 329 Croxted Road, London SE24.

Microdrives break the £200 price barrier for home mass storage

ALTHOUGH BUDAPEST Radio Engineering invented the micro-cassette disc-drive in 1974 the rest of the computer world stayed with 5in. drives or bigger. Now Sinclair, Sony, and Hitachi are all launching micro-drives in the next few months and BATS-NCI is importing the Hungarian drive.

Sinclair's Microdrive appears next month, and Sony is selling a 3.5in. floppy disc to other computer manufacturers which will have twice the capacity of traditional 5.25in. discs yet costs about £200. Hitachi's 3in. disc system will be even faster but more expensive.

Bill Musker of BATS-NCI dis-

covered the MCD1 micro-cassette drive by chance on a trip to Hungary: "I happened to notice one sitting on someone's desk". He was convinced that the Hungarian drive which takes a 3in. floppy-disc protected by rigid cassette was ideal for low-cost micros.

Now Commodore wants to use the drive for the Vic-20. David Briggs,

head of the hardware support division says that Commodore is acting as a catalyst between BRE and BMB Computers who will be developing the system. If tests of the prototypes prove favourable Commodore will market a twin-drive 300K system after Christmas; but Briggs is still cautious: "The Hungarian company is a totally unknown factor in this market."

Meanwhile Premier Publications has already adapted the BATS-MCD1 for use with the Video Genie and UK-101. A Dragon version will be available for less than £200 by the end of the month from Premier Publications. Telephone 01-659-7131.

Painting the Mary Rose made easy with Spectrum digital tracer

DIRECT INPUT of images to screen is no longer a dream since the release of a digital tracer for the Spectrum.

The RD Laboratories Spectrum digitiser consists of an arm which you use to trace the picture you want displayed on screen, and software routines which allow you to change colours or shade in parts of the display on screen or to save the picture as a display file or copy direct to a printer.

At £49.95 the RD Digital Tracer could save hours wasted plotting in individual points or lines to build up complicated pictures. RD's tracer will also work on the ZX-81 although with less spectacular results. Details from RD Laboratories: telephone 0920-84380.

Open sesame for dial-a-game and electronic mail for £60 from Oric

January's Launch of the Oric modem will bring telesoftware and electronic mail within the budget of home computer owners. The £60 modem will plug in to Oric's £100 16K microcomputer which was revealed in October's Your Computer.

An autodialler for telephones, and Prestel and viewdata facilities can be easily added to the modem. Sinclair had hoped to be first on the market, but his low-cost adaptor for the Spectrum will now not be available till the spring after Oric and Micronet. Oric's Peter Harding says "Sinclair will probably copy ours."

Oric will launch the modem with a free dial-a-game service which will allow users to download a variety of programs at any time of day or night under a name which could be tempting providence. Microcomputing already resembles a pantomime, complete with wicked uncle, without Oric calling this facility Aladdin's Cave.

Peter Harding is enthusiastic about sending programs down the telephone wires. "Telesoftware is

going to be the medium of the future for software." The combination of Oric 1 and the modem will convert a television into a receiving station which can display pictures and text sent by any other Oric owner with a phone, for just £160.

Disabled computer enthusiasts now have their own version of the Spectrum. Possum's system allows the handicapped to direct a light scan around an indicator panel by using an expanded keyboard or pneumatic input to select the computer function they require. Details from Possum Controls: telephone 0753-79234.

Micronet offers Prestel for £50

BRITISH TELECOM leads a consortium hoping to draw 100,000 micro users into the Prestel network by offering adaptors for £50 to £100. When it opens on January 1, 1983, Micronet 800 will also provide a 30,000 page database for those micros linked to Prestel through the telephone system. The subscription fee to Micronet will be around £1 a week.

On top of the 200,000 pages of information already on Prestel, the service will include buyer's guides, user-group news, a bulletin board, magazine features and advertising, games and prizes, and an electronic mail facility. But of greater interest to micro users will be the 20,000 pages of downloadable software, some of it free of charge.

At the same time, Prism Microproducts will supply Prestel adaptors for the ZX-81, the Spectrum, BBC, and later the Vic and the Dragon.

Audiogenic is chess Boss

AUDIOGENIC CLAIMS that Boss, a Vic-20 chess game, has triumphed against programs for the Pet, Apple and Texas TI-99/4. Boss requires a minimum of 8K memory and costs £14.99 from Audiogenic, PO Box 88, Reading, or from most Commodore

Epson's £500 portable could be the shape of things to come

EPSON'S PORTABLE computer, the HX-20, is the shape of things to come. Within a few years portable machines will capture at least 40 percent of the microcomputer market, say the experts.

For less than £500 the HX-20

includes a built-in printer, an LCD screen and a full-size typewriter keyboard, but weighs under four pounds. The use of CMOS circuitry allows 50 hours battery operation from built-in NiCad batteries which can be recharged overnight. Pro-

grams and data can be retained in RAM when the power is switched

The liquid-crystal display gives four lines of 20 characters or 120 by 32 dot graphics. It can act as a window on a larger screen 255 characters wide. Like the Amber 2400, which has the same Epson mechanism, the dot-matrix printer uses an inked ribbon to give 24 columns on plain paper.

The 32K ROM containing the operating system and Microsoft Basic can be expanded to 64K, while another 16K RAM can be added to the 16K present on board. The compartment to the right of the screen can take a micro-cassette drive or ROM and RAM cartridges.

RS-232C and serial interfaces provide for connections to a Modem, disc drive and larger printers. Other features include a clock-calendar with an alarm and a four-octave sound generator.

BBC smashes the system

MOST BBC MICROS to date have been supplied with the 0.1 operating system which cannot support disc drives. Among its other short-comings is a bug which causes occasional problems in saving to tape and the inability of the RS-423 port to receive data. Now Acorn is supplying the new 1.2 ROM free of charge to owners with the 0.1 system in EPROM and also to people who buy peripherals which require the new ROM. Owners with the 0.1 system in ROM will have to pay a replacement fee of £10.

Disc drives for the BBC also need a disc interface. This will cost £70 plus up to £15 fee for fitting. Acorn's BBC disc drive costs £264 and has a capacity of 100K. A rather cheaper 163K Control Data drive is available from Microware, 637 Holloway Road, London N19. Telephone 01-272-6398.

Sord reveals £100 4K colour micro

Now sord, one of Japan's biggest computer manufacturers, is joining the battle for Britain's home micro market. Sord describes the £100 M5 as a "variety computer" which is supposed to be capable of anything from "playing intellectual games" to "data processing". Software will be

supplied on cassettes and cartridges. The all-singing, all-dancing machine will have 4K user RAM plus 16K video RAM, and 8K ROM with built-in monitor, with full colour graphics including 32 types of sprites. The Z-80A based M5 is

about the same size as an Atom with

a Spectrum-style keyboard. It should start appearing in Britain from January.

Plug-in cartridges for the M5 will include PIPS, a home version of the management package which has helped Sord to 20 percent of the Japanese market.

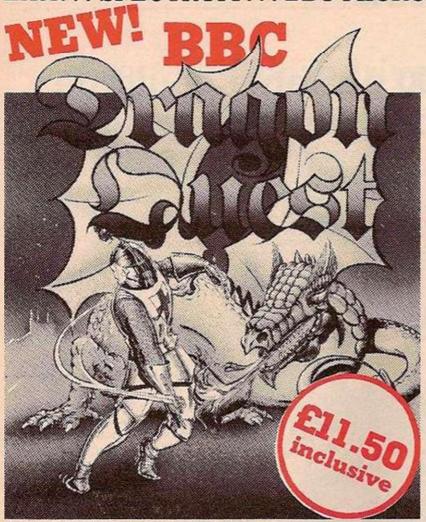

Manchester stages bigger and better Northern Computer Fair

FOLLOWING THE SUCCESS of our Earls Court show in April Your Computer has organised the Northern Computer Fair to be held at Belle Vue, Manchester on November 25-27. Over 38,000 people, mainly from London and the Home Counties, visited Earls Court.

The Belle Vue show will give northern readers an opportunity to try out the products of more than 80 computer companies. The Sinclair Village is already fully booked and it will be even larger than at Earls Court. The latest in machines and software will be on show.

Like a camel the Memic-81 goes a long way without refuelling. It allows you to store a program for up to 10 years and access it almost instantly. It uses a CMOS memory chip and 10-year life Lithium batteries. Loading a program requires a couple of Pokes and a USR call. A 2K version is priced at £28.70, and the 4K version costs £34.45 from Cambridge Microelectronics, 1 Milton Road, Cambridge CB4 1UY.

COMPUTER CLUB_

Computer Club is here to encourage you to start your own local computer club or, if one already exists, to join it and become involved. We would like to hear of anything which has made your club a success, or of any projects or programs you are developing.

Southampton rings the changes

Each month in Southampton the Southern Gas Computer Club meets in the Corporation HQ. Many members are professional programmers but Paul Bond finds they share many of the obsessions of the home hobbyist from Pac-man to computer art.

IT IS REWARDING to discover that we keep local user groups abreast of developments even on their own doorsteps. This month's lecture on new micros included - thanks to our October issue - the MPF-II, which is marketed by a Southampton company. Members hope that the machine will shortly be demonstrated

Derek Cambray, who gave the talk, is systems programming controller for Southern Gas - so he is equally at home with an IBM-3032 mainframe or a ZX-81. This might lead one to conclude that the club has some very highly-qualified members, but it would be wrong to assume their activities are mindbogglingly esoteric. Although the core of the club was formed about six months ago in Southern Gas's Data Processing Department, the members stress the club is very much for the enthusiastic amateur, as well as providing light relief for those accustomed to dealing in megabytes. Membership has grown steadily to include those outside the DP section, and vounger users were much in evidence during our visit.

The club itself is smiled upon by the higher echelons of Southern Gas management, who are keen to encourage computer literacy. There is no stinting on facilities. Not only are excellent coffee and sandwiches provided free of charge as well as two rooms, but there is full access to all the audio-visual equipment belonging to the corporation's publicity and training departments. This means excellent quality monitors, guaranteed to turn the more impecunious computernik red, green and blue with envy, are available at every meeting. Members are also allowed to use the company Pets - an 80-column machine with disc drive was running a script Adventure game with all the unexpected replies and jokes that around 96K can handle. Hardware was varied: two Pets, two BBC Model As, one Acorn Atom and a Spectrum, which produced impressive effects on a gargantuan Sony monitor. On the minus side, an unfortunate ZX-81 owner spent much of the evening failing to load his chess game.

One of the committee members, Andrew Craddock, had an unusual application for his Acorn Atom. A bell-ringing enthusiast, he has developed a program which, via a speciallybuilt synthesiser peripheral, produces soothing xylophonic sounds. Since all bellringing is based on different permutations of eight numbers, the Acorn's job is to stand in for the seven other rope-pullers - the player provides the eighth note, according to which style one is playing in. The styles are named after counties like Yorkshire, Lincolnshire and Rutland. Computerised campanology, no less.

Ian Smith, another committee member, produces the club's newsletter - a daunting task well-executed, with the aid of John Trippick's impressive artwork. He took on the job because he was a member of two other micro clubs and, he says "I couldn't understand either of the newsletters"

Three issues have been produced already and are circulated among a membership of 60. For the future, the club's committee which, apart from Andrew Craddock, Ian Smith and Derek Cambray consists of Charles Dickens, Andy Harker and Dave Walker, plans to set up an extensive software library, and to continue their successful series of lectures on individual types of machine. If you want to find out more, contact Andrew Craddock on Southampton 824496.

Local society news

Computers in the Chilterns

THE RECENTLY-FORMED Chiltern Computer Club caters for enthusiasts from the Dunstable and Leighton Buzzard areas. Their meetings are held in the function room of the Five Bells pub in Eaton Bray at 7.30 on the second and fourth Mondays of each month. Telephone Stephen Betts on 0525-220922 for details.

BBCs in Preston

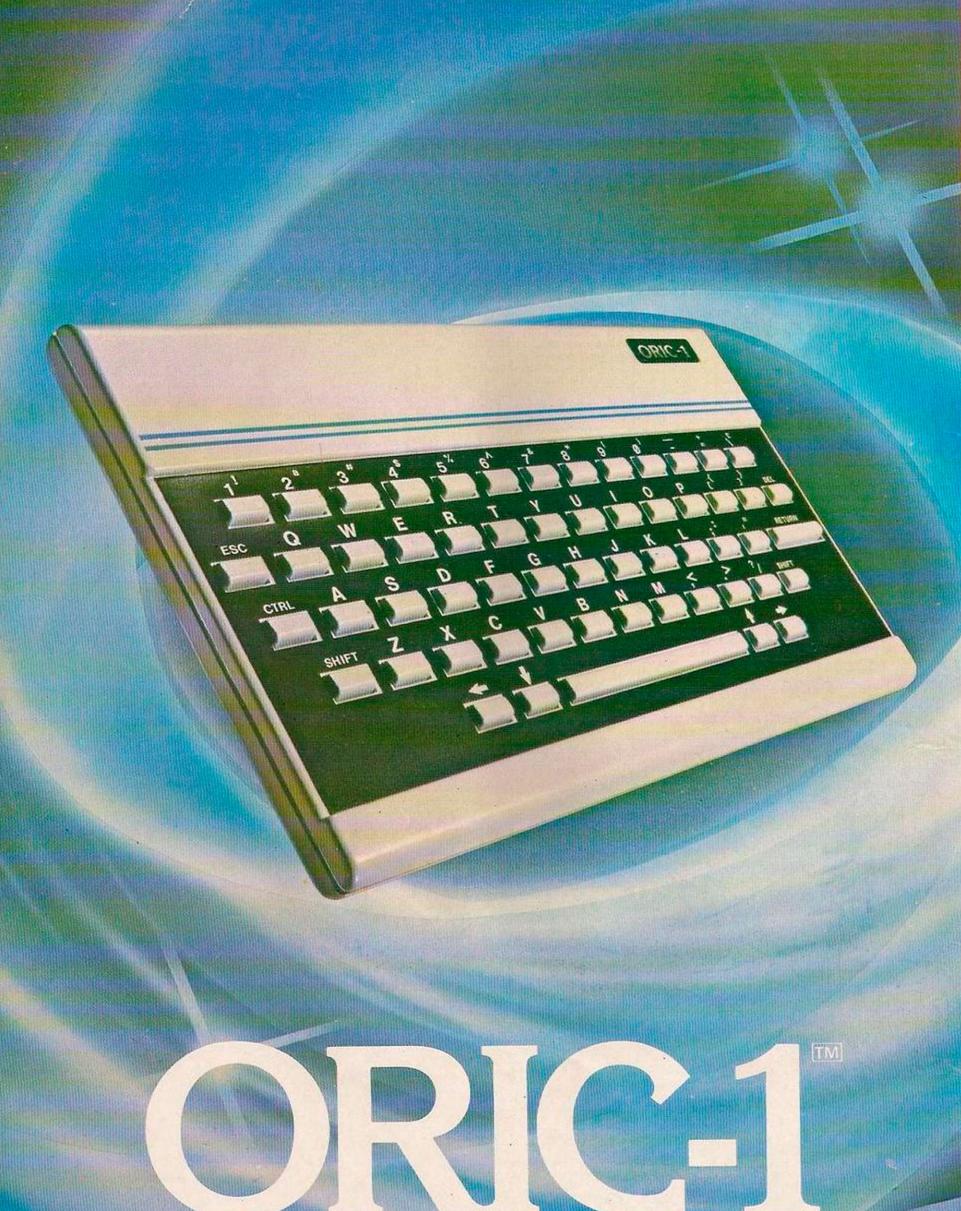

PRESTON AREA BBC Microcomputer User Group is starting a software library and a regular newsletter. The library will be run on a points system, with one point allocated per pound of purchase price. Members' programs will be evaluated by the club. Meetings take place at Preston Polytechnic in Room F2. For details, contact D Coulter, 8 Briar Grove, Ingol, Preston, Lancashire PR2 3UR.

Dublin micros

THE IRISH Amateur Computer Club, recently formed, wish to hear from anyone interested in personal computing in the Dublin area and other parts of Ireland. Contact Martin Stapleton, 48 Seacourt, Clontarf Dublin 3. Telephone 331304 or send stamped, addressed envelope to Brendan Haligan, 22 Gormore Avenue, Finglas South, Dublin 11.

Hampshire amateurs

THE FAREHAM and Portchester Amateur Computer Club have recently organised a referral service and users' group for the BBC Micro. The group meets at 7.00pm on the third Monday of each month at the Portchester Community Centre. Contact: Peter Smith, 23 Sandy Close, Petersfield, Hampshire. Telephone: 0730-4059, evenings.

TIMELESS TECHNOLOGY FROM ORIC PRODUCTS INTERNATIONAL

Computer Computer Challenge 16 colours

16 colours professional keyboard full graphics real sound

- Superb styling
- Choice of 16K RAM or massive 48K RAM
- Ergonomic keyboard with 57 moving keys
- 28 rows x 40 characters high resolution
- Teletext/viewdata compatable graphics
- 6 octaves of real sound plus Hi-Fi output
- Centronics printer interface and cassette port
- Comprehensive user manual

OPTIONAL MODEM OFFERS COMPUTER PHONE LINK FOR:

● ELECTRONIC MAIL ● TELESOFTWARE ● PRESTEL

THE REAL COMPUTER SYSTEM

£99.

incl VAT

COMING SOON, TO COMPLETE YOUR SYSTEM: ORIC MICRO-DRIVE DISCS & SPEED PRINTER

FOR HOME: The ORIC-1 is the professional alternative for home computing. Superbly styled, the 57 key layout is based upon computers costing many times more than the ORIC, and will help the whole family to learn and understand computing, right from day one. The ORIC incorporates an improved version of Microsoft Basic for ease of programming and use. For the enthusiasts the computer has laser zaps, explosions, etc. pre-programmed for games use, with Hi-Fi output for incredible effect. The communications Modern will allow 'Telesoftware', message sending, and Prestel use.

FOR BUSINESS: The ORIC-1 is the answer to many day to day problems. Software is becoming available for payroll, accounts, stock-control, and many more systems to help your day to day business organising and control. In addition, the ORIC COMMUNICATIONS MODEM will low you to access up to 200,000 pages of Prestel

allow you to access up to 200,000 pages of Prestel information, to send and receive 'electronic mail', to book hotels, and flights (and pay for them) and to look at the latest stock-market and share indexes.

In short the ORIC-1 is a must for all businesses large or small.

HOW TO ORDER YOUR ORIC-1: By phone:
Just ring our telesales number Ascot (0990) 27641.
By post: You can pay by cheque, postal order
ACCESS – BARCLAYCARD – AMEX – DINERS.
(Please allow 28 days for delivery).

Money back if not satisfied.

The Hall

MODIL CONTROL OF STREET OF

There address House designed

Today's micros offer tremendous opportunities for colour graphics. You do not need to be Salvador Dali to conjure up surreal shapes in unnaturally bright colour any more. Tim Langdell illustrates graphics for the beginner, from simple shapes to 3D rotations.

HIGH-RESOLUTION Drawing and Plotting is a feature of the BBC Model B, the Dragon 32 and the ZX Spectrum. Although the BBC machine has finer definition both the Dragon and the Spectrum have such built-in facilities as circle drawing.

Simple plotting

The Spectrum is the easiest to use for simple Plotting to the screen. You simply envisage the screen as a matrix of dots 256 wide by 176 high and use a straightforward Plot X,Y statement to place a dot in the required position. Adding Over 1 to the statement removes the dot:

PLOT OVER 1; X,Y

On both the BBC and the Dragon you must first choose your mode of resolution. The BBC offers a choice between a 256 by 16 graphics screen, 256 by 320, or 256 by 640.

Once the level of resolution is set, you can use Move and Plot to place dots, or pixels, on the screen. Move has the form Move X,Y and moves the graphics cursor to the position X,Y on the screen without drawing anything. Plot

draws using the following, very simple form: PLOT X,Y,K.

X and Y are the co-ordinates again, but K can take one of the following values:

- 0 Move relative to last point.
- 1 Draw line relative in current foreground INK — colour.
- 2 Draw line relative in logical inverse colour.
- 3 Draw line relative in current background PAPER — colour.
- 4 Move to absolute position same as using Move.
- 5 Draw line absolute in current foreground colour
- 6 Draw line absolute in logical inverse colour.
- 7 Draw line absolute in current background colour.

Moreover K can have higher values: 16 to 23 draw the lines as dotted, and 80 to 87 draw filled triangles. The BBC has many more of these facilities than the Spectrum.

The Plot command is also used to draw lines on the BBC, whereas a separate Draw command is used on the Spectrum. This allows you to draw between two points defined by the last position Plotted and the co-

ordinates of another point given after the Draw keyword:

DRAW 128,88

The Dragon does not use Plot, but rather Set and Pset depending upon which mode of resolution you have chosen. In low resolution Set is used and in higher resolution Pset is used. Both Set and Pset have similar forms: Set (X,Y,C) and Pset (X,Y,C). The two coordinates of the point to be plotted are inside the brackets followed by a code number for the colour of the dot. In BBC Basic this colour is set with a GCol command just prior to the Plotting, whereas in Spectrum Basic one can either set the Ink colour globally or within the Plot statement itself, so that the colour is only that of the dot:

PLOT INK 2: 128,34

Drawing lines on the Dragon is done using Line, in the following form: LINE (100,100) - (130,135), PSET

The co-ordinates of the line's starting point are put inside the first brackets. The ending point is put in the second brackets. The statement must then be terminated with PSet.

The Dragon can also draw a box with these co-ordinates by simply adding a B after the PSet. Adding BF, moreover, creates a filled box at those co-ordinates.

More complex statement

The Dragon also has Draw, but this refers to a more complex Basic statement. Using Draw on the Dragon you can create a whole series of dots and lines held within a string. The following aspects may be included in a Draw expression:

M = Move the draw position

U = Up

D = Down

L=Left

R = Right

E = 45° angle

 $F = 135^{\circ}$ angle $G = 225^{\circ}$ angle

 $H = 315^{\circ}$ angle

X = Execute as substring and return

C = Colour

A = Angle

S = Scale

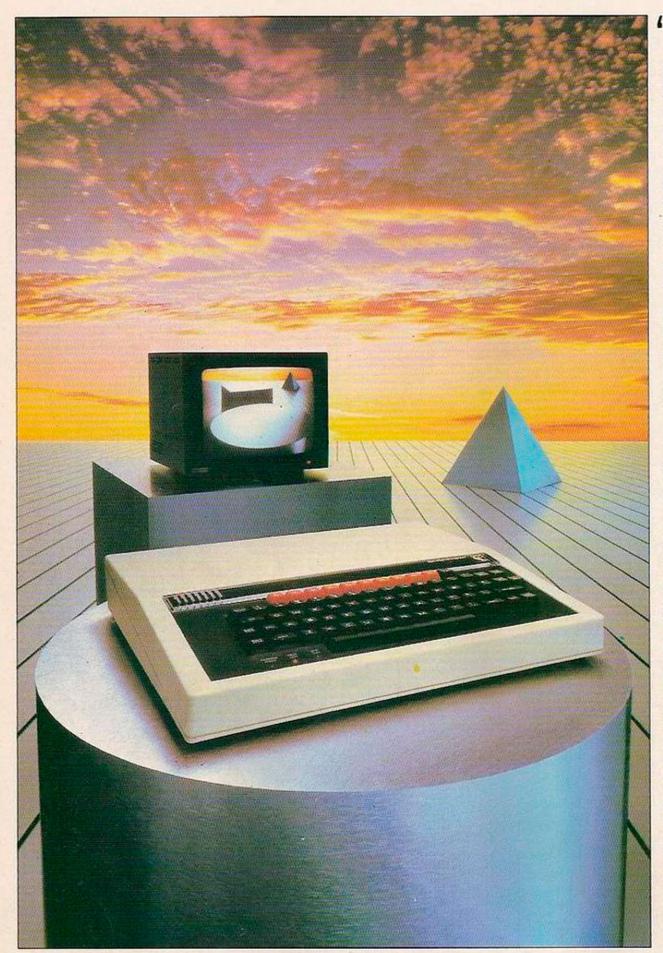

N = No update of Draw position

B = Blank - no Draw, just Move

In many ways this range of options is similar to the range of values of K on the BBC machine, plus the ability to define Drawing at angles to current positions, and scaling a graphic up or down. A Draw string might be:

10 DRAW "BM128,96; E25; F25; G25; H25" This draws a square standing on one of its corners.

(continued on page 25)

Broader horizons

hether your interests lie in business, educational, scientific, control or games applications, this system provides a possibility for expansion which is unparalleled in any other machine available at present, comments Paul Beverley in the July 1982 edition of Personal Computer World.

The BBC Microcomputer can genuinely claim to satisfy the needs of novice and expert alike. It is a fast, powerful system generating high resolution colour graphics and which can synthesise music and speech. The keyboard uses a conventional layout and electric typewriter 'feel'.

You can connect directly* to cassette recorder, domestic television, video monitor.
disc drives, printers (dot matrix and daisy
wheel) and paddles. Interfaces include
RS423, inter-operable with RS232C equipment, and Centronics. There is an 8-bit
user port and 1MHz buffered extension bus
for a direct link to Prestel and Teletext
adaptors and many other expansion units.
The Econet system allows numerous
machines to share the use of expensive
disc drives and printers.

BASIC is used, but plug-in ROM options will allow instant access to other high level languages (including Pascal, FORTH and LISP) and to word processing software.

A feature of the BBC Microcomputer which has attracted widespread interest is the Tube, a design registered by Acom Computers. The Tube is unique to the BBC Microcomputer and greatly enhances the expandability of the system by providing, via a high speed data channel for the addition of a second processor. A 3MHz 6502 with 64K of RAM will double processing speed; a Z80 extension will make it fully CP/M** compatible.

The BBC Microcomputer is also at the heart of a massive computer education programme. The government has recommended it for use in both primary and secondary schools. The BBC Computer Literacy Project includes two series of television programmes on the use and applications of computers.

There are two versions of the computer. Model A, at £299, offers 16K of RAM and Model B at £399 has 32K of RAM.

For technical specification and order form, send stamped addressed envelope to P.O. Box 7, London W3 6XJ and for details of your nearest stockist ring 01-200 0200.

(continued from page 23)

Both the Dragon and the Spectrum can draw circles with a single command; the BBC cannot. For the Spectrum, a simple Circle X,Y,R is needed, where X and Y are the coordinates of the circle's centre and R is its radius. The Dragon's statement is a little more complex because it makes allowance for drawing ovals and only parts of circles. It has the form

CIRCLE (X,Y),R,C,HW,S,E

where X and Y are the centre's co-ordinates again, R is the radius, C is the code of the colour to be used, HW specifies the height/ width ratio, S specifies the starting point of the circle, and lastly E specifies the end point of the circle.

The Spectrum attains partial circles and arcs by using its Draw command in this manner:

DRAW X,Y,PI

This would draw a semi-circle. Spectrum owners might like to try this brief program by Andrew Glaister:

PLOT 55,27: DRAW OVER 1; 120,120,59 3*PI This single line actually produces quite amazing results which are peculiar to Spectrum Basic's Over and Circle drawing facilities. Over, on the Spectrum, operates exclusive Or printing to the screen, and this is also available on the BBC machine.

The Dragon 32 is the only machine of the three with a Paint command. This works by simply stating the starting point of the Painting process, the colour of the Paint and the colour of the line where the Painting should end.

For those with a Dragon, program D1 uses both the Paint and Get/Put features.

Get and Put are Dragon commands which can come in very useful for fast-moving games and animation. They Get an area of the screen within a box, defined by co-ordinates X and Y, and Store the points which make up that box in an array.

This array can then be put back anywhere else on the screen. The BBC machine has such fast Basic that it can attain similar results by simply Plotting or Printing user-defined characters on the screen.

The Spectrum however, has neither the Get/Put facility, nor the speed of the BBC machine. In trying to speed up graphics in games it is worth trying to put the characters into a string on the Spectrum, and then Printing the string at progressive positions on

The alternative on the Spectrum is the Poke to the screen, but this can be difficult due to the way the screen is mapped.

The first byte of each character position on the first eight rows is Poked first, followed by the second byte, and so on until the characters in the first eight rows are complete. Then the next eight rows are done in the same way, and finally the bottom eight rows.

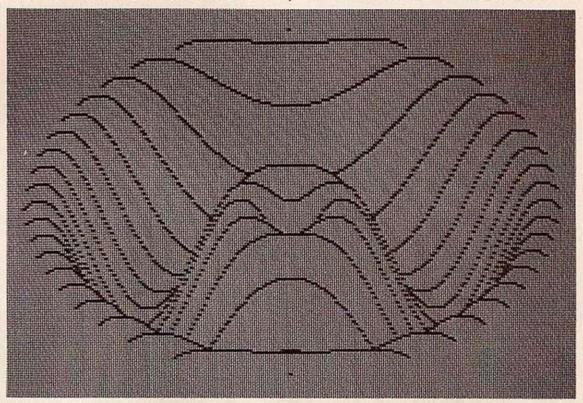

The Dragon can perform fairly smooth graphics using its Get and Put instructions. Here, for instance, is a program which Gets a circle in the upper left-hand corner of the screen and Puts it at intervals across the screen, clearing the screen between each Put. The fairly smooth motion of the Dragon is illustrated in program D2.

The Spectrum is slower than the other

machines, and short of machine code you will have to resort to tricks to portray moving graphics.

For instance, if you have two objects moving on the screen at the same time - a laser beam or bullet speeding toward a spacecraft for instance, then you would be advised to determine the speed of the spacecrast - when no firing is occurring - by the length of an

the character you are displaying, say, an alien created with user-definable graphics. Then Poke the first byte into the first location of the display file, 16384, followed by the next byte Poked to the location 32*8 bytes further on, and so on through all eight bytes. Then Poke these locations with zero to wipe the character off, and go on to Poke the same eight bytes into locations 16385, 16385+(32*8), and so

SPECTRUM

*COS(PI/B)

overall delay loop. When the laser is fired, the delay loop slowing down the craft should be decreased and the travel of the laser arranged to take its place.

Craft and laser

Thus the movements of the craft and laser would interchange rather than having the craft stop every time the laser fires. Even this method, though, cannot allow you to create very complex moving games on your Spectrum, although you can Poke to the

First define the eight bytes which make up

90 PLOT X1, Y1: DRAW -X1, Y-Y1

100 PLOT X1,Y1: DRAW 255-X1,Y-Y1

110 NEXT Y

on. You will find that this allows you to create faster-moving graphics, although your character will appear to scroll into and out of existence.

Holding the graphics information in arrays can also be recommended for the Spectrum. Using control characters in such strings allows creation of very complex figures which would otherwise take several lines of Basic.

The Dragon lets you add either S or R to a Draw statement in order to scale the drawing up or down, or Rotate it about a given angle. You can imagine how useful this is if you want

(continued on next page)

(continued from previous page)

a plane to bank toward you and grow in size as it does so.

Neither the BBC nor the Spectrum has these facilities but simulating rotation is not too difficult. It involves the realisation that, given any set of co-ordinates, X and Y the new coordinates will be:

New X = Old X *COS a - Y(old) *SIN a New Y = Old Y *SIN a + X(old) *COS a

where a is the angle you are turning the shape through. Program S1 is an example written in Spectrum Basic but easily translatable to the BBC machine.

Rotating shapes

This draws a parallelogram in the centre of the screen, then draws various rotations of the shape on the left-hand side. Unfortunately, in Basic, this routine is rather slow compared to the Dragon's built-in features, and not much use in games involving motion of any appreciable speed.

The simplest way to produce impressive graphics on the machines is to use some quirk of the way the machines does something. The one-line program for the Spectrum is a very good example of this. Another is the moiré kind of pattern that one can quite easily obtain on any of the three machines using their linedrawing facilities. Program S2 is a version for the Spectrum. A multi-coloured version of this can easily be created by adding Inks to the Draw statements.

Three-dimensional graphics are possible quite easily on each of the computers. An example for the Spectrum is shown in figure 1 but almost an identical program could be written for the other machines.

You can try Plotting different functions by changing line 60. In this example the function

> FN A(T) = 30*SIN T/12, where T = SQR (X*X + Y*Y)

You can also vary the resolution of the Plot by changing the value of R in line 30. This can be anywhere between about 2 and 10. With R = 10 the Plot will take about 15 minutes, but at resolution 2 it can take several hours.

The Dragon Draws rather spiky-looking circles in one of its modes, but even this can be used to advantage. Program D3 makes a kind of lace pattern. A rather nice spiral cobweb is created by D4.

The BBC machine has a unique facility in that by drawing a series of curves or lines in a variety of colours and changing each of them, in turn, into one other colour, an impression of movement can be given.

Combining two ideas in the creative graphics package for the BBC by John Cownie it is possible to create a ball which appears to spin in mid-air. See figure 2.

In fact, the three colours involved have all been designated as blue, and then selected colours redesignated as white, and back to blue again, in sequence, to give the appearance of movement.

Finally, this month's cover was drawn on the BBC. Essentially several partial elipses were drawn turning left or right equally frequently, see figure 3.

Line 40 contains all the parameters which are passed to the procedure for the large spray and line 80 passes the necessary data for the smaller spray. Lines 30 and 70, by the way, create the random colours involved.

It will improve your ZX SPECTRUM graphics in ways you wouldn't believe possi

Your new ZX Spectrum is literally packed with sophisticated graphics. Colour. High resolution. Plot. Draw. Circle. Border. Ink. Paper Colours. User-defined characters to name just a few!

That's why we have packed the new Spectrum Print 'n' Plotter Jotter with every facility to exploit your graphics to the full

After the first few weeks of "playing" with your computer you will want to get down to serious programming and planning in which professional looking graphics should play a major part.

What better way to work it out than with a Print 'n' Plotter Jotter?

The professional pad

Print 'n' Plotter is not just another programming pad.

Just look at the specifications:

BIG SIZE 161/2" x 113/4". 100 Pages — 50 Print Grids and 50 High Resolution Plot Grids.

Printed on high-quality tracing paper, enabling you to overlay the pages for direct co-ordination between PRINT and PLOT or to copy from illustrations, maps, charts, photos etc.

PRINT Grids show all numbered co-ordinates for the 704 screen positions, plus INPUT lines.

PLOT Grids show every numbered co-ordinate for the 45,056 Pixels! ach pad contains 600 user-definable grids for use with the BIN n, POKE "a" function.

And the whole thing is fully bound with fly leaf cover and complete with a set of seven colour pens!

The simple way to get serious

Spectrum Graphics can become very complex, so before you start to program the best way is to work it out on a Print 'n' Plotter and save all

Take for instance the common CIRCLE. With a Jotter you can establish the exact screen location for the centre in seconds, and it will stop you running out of screen because of a too large radius. Working our DRAW is similar: pre-determine DRAW lines and PLOT positions before you start. With a Jotter you can build-up graphics using every facility with a direct co-ordination between each

For instance, correct PLOT OVER or PRINT OVER positions will be easy with a Jotter.

See the show for just 60p!

To demonstrate the graphic possibilities with the SPECTRUM JOTTER we have produced a cassette-based Demonstration program for only 60p (inc VAT and P&P). Why not send for a copy, or order it together with your JOTTER?

Just part of a range of ZX products

The Spectrum Jotter is, of course, an upgraded version of our popular ZX81 Print 'n' Plotter Jotter and Film. For ZX81 owners these are available

by direct mail or through a growing number of retailers and compshops.

The ZX81 Jotter is a 100 page Graphics pad that exploits to the full the graphics facilities of that micro. ZX81 Film is a matt film version of the Jotter which is re-usable and ideal for 'copying' graphics.

Our manual: "ZX Graphics programming made easy" explains everything you need to know about using the ZX81 products, and when used in conjunction with the Spectrum cassette will prove to be the definitive guide to the subject.

And for ZX users (whether Spectrum or ZX81) we still market Printer Paper at £1 less than Sinclairs!

Why not write and place your order today? Graphics can be a very serious subject . . . Print 'n' Plotter products can make it easier . . . and better in a hundred ways you never thought possible!

Please forward me the following products:

Another day, another planet, another micro
— but the Ace is so fast that even Bill
Bennett had to switch into hyperdrive to review it.

THE JUPITER ACE is a radical departure from the mainstream of microcomputing, and could prove to be the start of a very important new trend. Rather than accepting the prevailing wisdom, Jupiter Cantab designed the machine around the Forth language. In a way, this makes the Ace a breakthrough — it is both the first mass-produced home computer not to use that tired old lady of micro languages, Basic, and is also one of the fastest micros ever made.

The speed element is vital; it is more or less the justification for using a hitherto arcane computer tongue. But speed is not the only advantage of Forth, or indeed of the Ace. It has that all-important feature; structure. Structured programming is definitely the "coming thing". It is preferred by both educationalists and professional programmers alike, and leads me to another fashionable computer buzz-word; portability.

Major differences

Portability is an important conception in microcomputing. Put simply it means the ability of one computer to run a program written for another, taking the hardware differences into account. Forth is highly portable. Providing the relevant hardware details, such as screen and memory size, are taken into account, any program written in Forth should run on any Forth system.

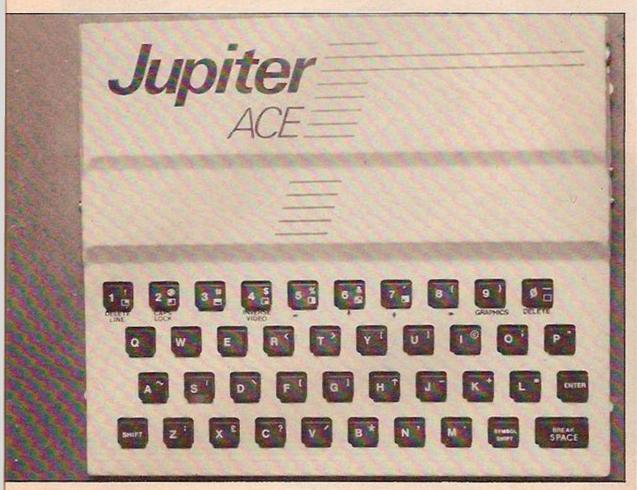

Programming in Forth is so fundamentally

different to programming in Basic
that some people prefer not to
call Forth software "programs"
at all. It is important to discard
all your current ideas about
programming before you start
with the language Forth.
When writing a Basic

program, it seems quite normal to think of the control passing through program lines. These lines are like rails along which the control runs, complete

with loops and Goto jumps. The control path is often difficult to follow even in your own, short, well-documented programs. Imagine trying to sort out someone else's epic and rather badly-documented program, which they quickly wrote in the middle of the night. This just does not happen with Forth, because each little section of code is debugged as it is written, and the control path does not really exist as a concept.

A Forth system contains a set of words, called a kernel in some implementations. On the Jupiter Ace they are referred to as ROMwords, because they are in the machine's 8K of read-only memory. These words act on whatever number is on the top of the stack,

which is the area of memory that the system plays with.

The best way to think of a stack is as a pile of plates. These plates are the numbers. Plates can be added to the top of the pile at any time, but only the one on the top can be worked on. This is a much more convenient way of managing the memory than using addresses, though with Forth it is still possible to define variables and constants.

Using Forth

Each word in the ROM-word set can be thought of as a call to a machine-code subroutine. Usually any value sent into a subroutine is called a "parameter". In Forth the relevant parameters are those numbers at present on the top of the stack. For example: plus is a Forth word - written + - which adds together the two numbers at the top of the system stack, and then puts the resulting number in their place. Thus, on the Jupiter, when you input

2 ENTER the screen shows 2 OK

3 ENTER the screen shows 3 OK

+ ENTER the screen shows + OK

. ENTER the screen shows 5 OK

The command "." prints out whatever is currently on the top of the stack. For convenience I will call this "dot". We can think of the numbers 2 and 3 as parameters sent to the plus routine, and the resultant value 5 as the parameter sent to the dot routine.

As soon as a Forth word is entered it is obeyed. A number of words can be entered at a time. For example, our example could have been input as:

23 + . ENTER

The result 5 is printed immediately at the cursor position. It is very important to remember to put a space between all Forth words or numbers as they are entered.

Forth really comes into its own when users start to define their own words. This is very simple to do. New words are formed by combining words already defined, and in some cases using numbers which are placed on the stack. For example, to write a word that will add two numbers together and then print out the result, we shall use the name Plus:

: PLUS + . ; ENTER

The colon at the beginning indicates that a new word is being defined. What follows it -Plus in this case — is the name of that word. We input the + and . to tell the computer that these are the Forth words which go to make up our word, Plus, and the semi-colon at the end closes the definition.

Once a new word is defined it appears on the top of the vocabulary list. The vocabulary initially contains the 140 ROM-words, and, the top word in the list is Forth. This merely indicates that the words below it constitute the main vocabulary. The Forth word VList makes the machine print out a list of all the words in the vocabulary, including all the new

It is possible to define the same word twice. If, having typed in the word Plus as I described you decided that you wanted to change it so that the screen cleared first, you would have to use the editor. Enter the following: EDIT PLUS,

and up comes the previous definition of that word, laid out thus;

: PLUS

The word CLS - clear screen - would need to be added before the word +. This is done by moving the cursor to the position where the extra word - or words - are to be inserted and typing that word in. The cursorcontrol keys are the 5,6,7 and 8, used in the

same way as on the ZX-81.

Once the word has been changed to the corrected form, typing Enter now places that word in the vocabulary. If at this stage you type VList, you would find that there are two versions of the word Plus in the list. The computer would always execute the second version, leaving the first for dead. This makes debugging software incredibly easy because any incorrectly-defined words can be tested as they are entered and continually hacked about until they reach a correct form.

Because all previous attempts at the same word are kept in the dictionary, you can return to these at any time. When the definitive version of the word has been created, you can save memory space by deleting with Replace all the intermediate attempts.

Unlike most implementations of Forth, the Ace has a substantial level of error-checking. For example, the stack will not overflow. It is also made more powerful by the ability to define words without the system crashing.

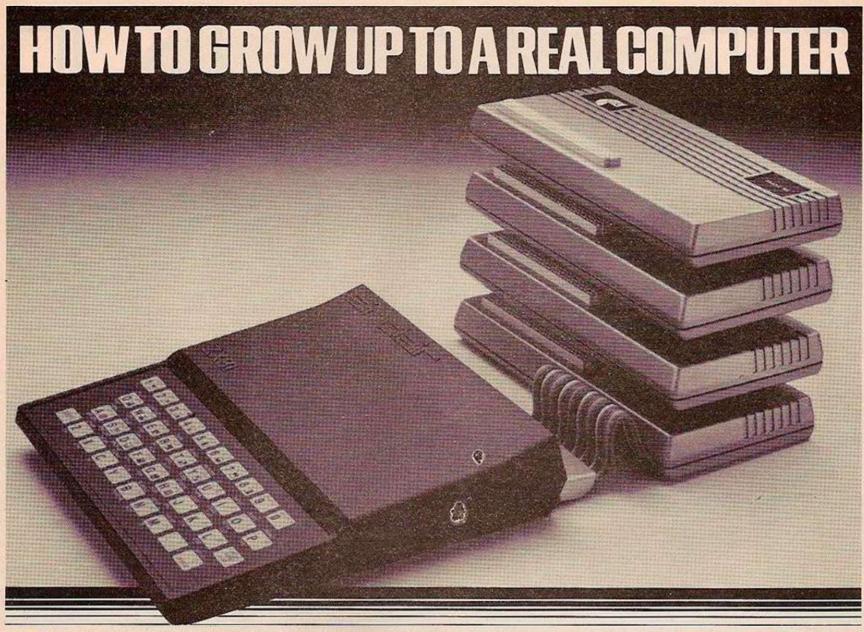

However, should you require yet more speed than normally available, there is a Fast command. This does away with the errorchecking, so it is wise to use it only when a program is totally debugged. It takes the computer's speed up to about 90 percent of a machine-coded program, but it does disable the break key.

At an end-user price of £89.95, the Jupiter Ace is an excellent way of learning an important new computer language. It will have a special appeal to those who feel that they have now grown out of their ZX-81s, especially as far as Basic programming is concerned. It will also be a Godsend to those who want the speed and economy of machine code but cannot grasp its principles.

Fast machine

The Jupiter Ace comes in a white plastic case, not all that dissimilar in style to the nowdefunct ZX-80's horrible box. It is undoubtably the machine's worst feature, and the costcutting that has been done here could turn out to be that ha'porth of tar that spoilt the ship.

The printing on the case is in a matt-black, broken only by a series of red lines. These red lines are obviously the microcomputer world's equivalent of the "go-faster" stripes that

If you're enthusiastic about microcomputing, sooner or later you'll ask yourself the question ... "where do I go from here?"

How BASICARE build into a complete computing package. PERICON-DROM for I/O,

This is particularly true if you own a micro with limited expansion and hardware peripheral options ... like

Now your question can be answered in three short words:

BASICARE MICRO SYSTEMS

BASICARE are the inventors, developers and manufacturers of a totally

unique microcomputing upgrade system.

It's the sort of system others have dreamed about ... a series of separate modules that

perform a whole range of microcomputing functions

that simply (and firmly) stack together.

If you're confused ... don't be ... you only have to think of it in terms of the way Hi-Fi equipment has evolved.

You buy the hardware you want and add to the system! Each module may have a separate function or integrate functions. And when you want more...you add more!

In short you can develop a whole range of hardware options that fit together to form a complete package ... "Computing" in the real sense of the word!

And what a package!

Apart from it's good looks and stability under working conditions,

BASICARE MICRO SYSTEMS offers a fantastic range of micro options for ZX81 users

Of course, such a system needs a starting point from which to expand. The heart of BASICARE'S system is a unique computer interface which we call PERSONA.

This one unit simply plugs into your ZX81 without modification and acts as the "brains" of the whole operation.

Thereafter you choose how you want to expand your micro by simply plugging-in more modules.

Look at the choice you have:

PERSONA — An interface module to enable an ORGANIC O to grow on the ZX81.

MINIMAP — A memory mapping device to extend the address space of the ZX81 from 64K bytes to 1 M bytes.

RAM 08 — A low cost, low power memory expandable from 2K to 8K.

RAM 16 — 16K Add on memory at remarkably low cost.

RAM 64 - A TRUE 64K Add on memory

DROM — Ultra low power memory backed by rechargeable battery for nonvolatile storage of programs and data.

TOOLKIT — A module fully socketed to take up to 8K bytes of utilities in

PERICON a — A general purpose, user programmable device providing 24 lines PERICON b — 24 lines of heavy duty output to access and control the outside

PERICON c - A module to drive 80 column printer with

Centronics type parallel interface. **USERFONT option** — User definable characters available for RAM 08, DROM and TOOLKIT.

Of course, there's lots more BASICARE Modules under development including joysticks, EPROM Programmer, Floppy Disc Controller and much more.

BASICARE is the sort of system that GROWS when you grow ... and remember, when you change your micro, you will be able to change to a PERSONA unit to suit your new equipment!

In short, BASICARE will serve you forever...no matter how big you want to grow!

As space is limited to describe BASICARE products, we have produced a fully brochure ... send for it toda

(continued from page 28)

teenage car owners sport to make their old Ford Cortinas look a little sleeker.

The truth of the matter is that the Jupiter is very fast. The manufacturer claims that it is the fastest microcomputer in this quadrant of the galaxy. This has a lot to do with the rapidity of the Forth language, but some of the credit has to go to the Z-80A processor which nips along at a rate of knots - 3.25MHz to be precise.

Speed implies heat, but there is not much danger of the Jupiter overheating, or at least a sight less danger than some machines, because inside that flimsy plastic case is plenty of breathing room and what is more, the case is better ventilated than that of the ZX range of computers.

Internal design

Sinclair cognoscenti will smile when they peer inside the case and see the heatsink. I often wonder why they are such odd shapes could it be they were designed by Picasso? Comparisons with the Sinclair machines will inevitably keep cropping up, because the designers of the Ace were, until recently, in the employ of Sinclair Research and so take some of the credit and blame for the ZX Spectrum.

Apart from the gross departure of choosing the Forth language, the design is fairly standard. Sinclair owners will find much inside the Ace's case that is familiar to them.

The keyboard closely resembles that on the ZX-81, both in the number of keys and their layout. But rather than having those horrid little squares that you have to struggle to push down as you program, the Ace uses a rubbery "moving-key" design. Personally I find it is a little like shaking a dead man's hand. The keys do at least have the advantage of being readable - that is, there are none of the Spectrum's red words which you can only track down using special spectacles.

Another small mercy that we can thank Jupiter for - or Zeus if you are Greek - is that there is no single-keyword entry to contend with. However, the designers probably did not abandon it for any good reason, but merely because the infinity of word names available to Forth makes it impracticable.

There are also some significant advances. For example, there are both upper and lowercase letters. It is also possible for the user to define his own character set - in fact by doing so, some reasonably high-resolution graphics are possible. In this way the graphics of the Ace remind me of a non-colour Spectrum. In normal mode there are 32 character positions across the display and 24 down.

In the Plot mode, there is a resolution of 64 by 48 points - not exactly high resolution. If you are prepared to play about with the character definition then this increases to a respectable 192 by 256.

The operation of the word Plot is like the other Forth words. The top three numbers on

CONCLUSIONS

- ■The success of the Jupiter Ace will depend on the machine-buying public's acceptance of another microcomputer language.
- ■The machine's development is certainly a brave gamble on behalf of its manufacturers.
- It will be of great interest to scientists, those with control applications, ZX-81 machine-code fans, educationalists and professional programmers who feel they cannot ignore the language.
- Home-computer users who have progressed beyond the beginner phase will like the language and the price but may balk at the lack of true high-resolution and colour graphics.

the stack are the parameters which are passed to a machine-code routine. At the top of the stack is a number which describes how the point is to be drawn, and the next two give its screen location.

Probably the biggest advantage of the Ace's picture quality over the ZX-81's is that the Ace has a rock-steady black screen on which any printing appears in white: the ZX-81 does the reverse which is not a natural way for a computer to behave.

The two machines certainly have a good deal in common, apart from the designer. The review machine did not have a power supply. That was no problem because I used the Sinclair Research one, which worked perfectly.

The user port on the rear of the Ace, closely resembles that on the Sinclair machines. It is not difficult to justify this as there are not really many ways of presenting the Z-80 lines at the edge of a board. Any device that connects to the rear of a Sinclair computer will snugly fit on the back of the Ace. All that is needed is a special cable that unshuffles the

It will probably take a few months at least for a budding Forth programmer to need more than the 3K of user RAM that comes as standard with the Ace, but should you ever require more, the Sinclair 16K RAM pack will fit the bill.

Forth was originally designed as a control language, and the Jupiter Ace makes a fine control computer. In fact, this may become its eventual role. There are two words, In and Out for controlling the data lines. Put the Ace together with any of the available add-on hardware designed for the Sinclair, and you have a powerful control system.

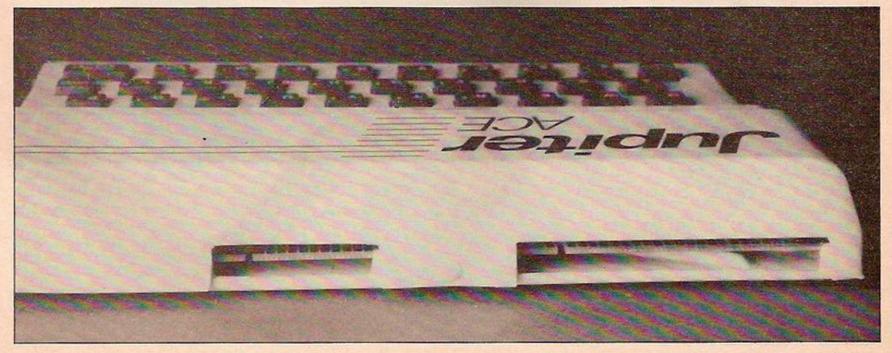

The way forward

Other features available on the Ace include a speaker, which can operate right across the audio range. But, like the Spectum's, it is very quiet. It is controlled by the ROM-word Beep, and can be manipulated very easily by the language. Again, Forth is ideal for this kind of programming, and musical sequences are among the easiest things to write on the Ace.

There is also a quartz timer, which doubles as the system clock. This can be accessed from Forth and has a number of possible applications. The timer sorts a number in four bytes, from 15403 to 15406. These can be extracted by use of the fetch word, written as @. I expect the most common use for such a facility will be in the timing of responses and in the generation of random numbers. Here is a very crude random-number generator:

: RAND 15403 @.;

Perhaps the way forward for the Ace is best indicated by the other port at the back of the machine. It takes the video lines out from the main card. Eventually it will be used for a colour video generator.

HARD COPY FOR M

Inexpensive printers for home computers were comparatively rare until recently. Simon Beesley takes a hard look at hard copy for the BBC Micro, Dragon and ZX machines.

UNTIL RECENTLY the Sinclair ZX Printer was unchallenged as the only low-cost printer available for micros. The Vic printer costs £230 and the cheapest printer for machines with RS-232 and Centronics ports is the Seikosha GP-100 for around £180. This prints an 80-column line and has full graphics capability but its price would probably be thought prohibitive by most home users.

The Amber 2400 costs £80.44 and can compete with the ZX printer on the same terms. It can be used on any machine with serial RS-232 or parallel Centronics ports. These are present on the Dragon, the Atom and the BBC. An RS-232 cable for the BBC Micro costs £6, parallel cables cost £11.44. Amber Controls also supplies an interface and cable for the ZX-81 and Spectrum at £21.85 and for the Vic-20 at £20.81.

The Amber 2400 is a dot-matrix printer which uses an inked ribbon on plain paper. It gives 24 characters a line in upper or lower case at a rate of 0.7 lines a second.

The cash-register-type roll is housed in a

rugged and well-finished casing. While substantially heaver than the ZX printer it is small enough — 8cm. by 16cm. by 16cm. — to be portable. A line-feed button is the only hardware control.

The great merit of the Amber 2400 is its print quality. On the ZX Printer characters are often indistinct. Using a ribbon on plain paper, rather than Sinclair's aluminium-coated paper, means that the Amber's characters are remarkably clear.

Two of the six control codes which can be sent to the printer select double-width or double-height print. Four different character sizes can thus be obtained: normal — seven-by-five dot matrix; bold height — 14-by-five; bold width — seven-by-10; bold height and width — 14-by-10. The other control codes set the graphics mode, indented print format, carriage return and cancel previous codes.

In graphics mode the bit pattern of each byte sent from the computer is printed as a single line of eight dots. With 144 dots per line from a width of 18 bytes, detailed graphic printouts can be built. Amber's user manual gives two programs to print from the screen display on the Dragon and the BBC. These are rather slow but could probably be improved on.

The commands for listing or printing a string differ with the computer used. On the Dragon, for example, LList prints a listing, while on the BBC VDU 2 enables all output to the screen to be also sent to the printer.

Similarly variable is the extent to which

control codes can be passed to the printer by control keys — rather than in a Print or VDU statement.

Since the code for ZX-81 characters is not standard and the Amber only accepts ASCII code there are problems in using this printer with the ZX-81. Amber's ZX-81 interface does not accept LList, LPrint or Copy, and the user must enter two software routines to send single bytes to the printer and convert to ASCII. This only allows you to print the contents of a string, not a listing.

Taking a listing from the Spectrum is possible but again you must first enter machine code and Basic programs. In view of this limitation the Amber cannot at present be considered a suitable alternative to the ZX printer for Sinclair machines. An adequate interface with the necessary software in ROM is what is needed.

But for other machines it fills the same role as the ZX Printer with the advantage of being considerably more versatile and more economical to run. Paper rolls are cheaper, costing £2.97 for five rolls as compared with £11.25 for five of the Sinclair rolls. The ribbons which cost £1.90 come in an easily-changed cartridge and last for around three 88 ft. rolls.

The facility for indenting carried-over lines by one space improves legibility but 24 columns are rather too few for a really satisfactory listing. However this drawback is compensated for by the clarity of the print and the choice of four different text sixes. Further

Below, left to right, an SP-42 printer, an Amber 2400 and a Model 81 with ZX-81 interface attached.

details from Amber Controls Ltd, Central Way, Walworth Industrial Estate, Andover, Hampshire. Telephone: 0264-65951.

Dean Electronics supply two Alphacom thermal printers with 40-column lines. Like the Sinclair printer they use an electric pulse from a moving stylus to burn the characters from aluminium-coated paper. They take 4.2in. thermal paper rolls which are 130ft. long and cost £1.30 each. Print speed is two lines a second.

The Model 81 for £108, complete interface board and leads, runs on the ZX-81 but will also work on the Spectrum when Sinclair release the RS-232/Network board. The full Sinclair character set including inverse and graphic characters is available.

The print quality is not as fine as the Amber's but somewhat better than the Sinclair Printer's: the blue characters show up more distinctly against an off-white background.

A paper-release lever makes fitting the roll relatively simple. There is also a power switch and a paper-advance switch. The unit measures 10.5in. wide, 7.5in. deep and 4in. high. Compared to the ZX Printer it has a reassuringly solid feel to it.

The ZX-81's printer commands cannot be used. Instead it is necessary to make USR calls to machine-code routines provided on an EPROM which is plugged into the interface board. These provide three facilities in either regular or enhanced mode. You can list, print a string, and dump the contents of the screen to the printer. Enhanced mode prints doublesize characters.

LET Z = USR 8204

for example, will print a listing in enhanced mode. Rather inconveniently, the ZX-81 needs to be in Fast mode before the printer can be used.

The ZX printer costs £59.95; at nearly twice the price, the Model 81 will only offer an alternative to those who value a far clearer printout and the option of enhanced mode.

The SP-42 is a slightly smaller version which can run on machines with RS-232 and Centronics ports. Dean Electronics also provide interface modules for most other machines like the Atari, the Pet and the TRS-80.

Like the Amber, commands to the printer are specific to the machine used.

PRINT # -2, A\$

for example will print the string A\$ from the Dragon.

Control codes provide features like vertical tab, line feed and carriage return. Sending the character-orientation code indicates which way up a character is to be printed - normal or upside down. Again, as on the Amber, the graphics mode can be set to plot a "bitmap". The printer recognises 95 ASCII characters as printable and prints in upper and lower case.

Dean Electronics are at Glendale Park, Fernbank Road, Ascot, Berkshire. Telephone: 0344-885661.

CONCLUSIONS

- The Amber 2400 costs only £20 more than the ZX printer but is considerably more versatile. It can interface with most popular micros at no extra cost other than the price of connecting leads.
- The use of economical plain paper and inked ribbon makes for a very clear printout from the 2400.
- The Amber benefits from the option of four different print sizes and a graphic mode; these facilities are easy to set through six control codes.
- The Amber's only drawback is that the width of the printout - 24 columns - is too narrow for satisfactory listings.
- The Dean Electronics Model 81 for the ZX-81 costs some £50 more than the ZX Printer but gives a better print quality.
- Sending commands to the Dean printer is less straightforward than on the ZX Printer but it offers enhanced mode as an extra.
- Like the Amber the SP-42 can interface with a wide range of micros but at £150 costs substantially more.
- Print quality is not quite as clear and it does not offer as many print sizes.
- In its favour are a 40 as opposed to a 24 - column line and a faster printout. These make it more suitable than the Amber for serious applications.

SILVERSOFF

SPECTRUM - BBC - ZX81

STARSHIP ENTERPRISE

Soar through the stars as a starship commander in this exciting new space ship simulation. This new, advanced version of Startrek uses the full colour graphics and sound facilities of modern micros. Full 3D — Klingon attacks, graphic hyper-warp, plus all the normal 'Startrek' features and a whole lot more, add up to one of the best games in the galaxy!!

48K Spectrum £5.95.

BBC Micro model 'B' £6.95.

ORBITER

Fast and furious action is what you get in this amazing Defender-style program for the ZX-Spectrum.

ORBITER is written entirely in m/c code and has full arcade features, including scanners, reverse, hyper-space, continuous scoring and sound effects, plus humanoids, landers, mutants and all the other alien nasties.

16K or 48K Spectrum £5.95.

GROUND ATTACK

Survival is the name of the game in this exciting Scrambletype arcade game for the ZX-Spectrum.

Your mission is to pilot your spaceship through tortureous caverns while destroying the enemy missile launchers and fuel dumps.

GROUND ATTACK is written completely in machine code.

And has full arcade features including lasers, bombs, explosions, continuous scoring and sound effects, plus rockets, fuel dumps and airborne aliens.

16K or 48K Spectrum £5.95.

Any hiring, lending or copying (except backup) of Silversoft software is strictly forbidden without written permission from Silversoft.

GENEROUS DEALER DISCOUNTS AVAILABLE

Silversoft Ltd, 20 Orange Street, LONDON WC2H 7ED.

KILLER SATELLITE

A mysterious Black Box has appeared in earths' orbit. You have to send your killer satellite to Probe it with high energy lasers. Amazing 3D colour graphics and sound for the Model B only £5.95.

3D CONNECT 4

An advanced, challenging four in a row game for the BBC Micro. Displayed in full 3D-perspective and using the extensive colour and sound facilities of the BBC Micro. Model B only £5.95.

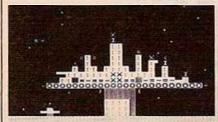

NEW! ZX81-COMPILER

Yes! Now you can write machine code on your ZX81. No more messing about with assemblers and disassemblers simply type in the BASIC program and the machine does the rest. ONLY £5.95.

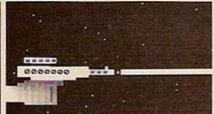

ZX81 ARCADE ACTION (New low prices)

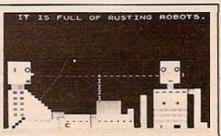

MUNCHER Exciting pacman game for the ZX81
ASTEROIDS "Just the thing for asteroid addicts"
INVADERS "Probably the best version of INVADERS"
ALIEN-DROPOUT Exciting ORIGINAL arcade game
STARTREK YES! you can be a starship commander
GRAPHIC GOLF 18 graphically displayed holes

And now for the big picture.

TRADER A trilogy of 16K programmes that combine to give an epic 48K graphic adventure. As a galactic trader, you deal with some very bizarre customers indeed. Will you live to tell the tale? ZX81 £10.50. VIC20 £18.50 (tape or disc).

SUBSPACE STRIKER Our top selling, big screen graphic game. With your deadly Antimat torpedoes, you unleash havoc in the Federation spacelanes and try to dive back to the safety of subspace, fast. ZX81 £5.50. VIC20 £9.50. 16K.

STARQUEST A voyage of discovery and adventure in the cosmos. With the help of your onboard computer, you seek a habitable planet amidst the perils of deep space. ZX81 £5.50.VIC20 £9.50. 16K.

ENCOUNTER Would you know what to do if you encountered extra-terrestial beings? In this adventure, you are snatched off the Earth and the space invaders play YOUI ZX81 £5.50.VIC20 £9.50. 16K.

ZOR Battle of the robots. Fight for survival in this action-packed strategy game. Megajoules of destructive energy in a futuristic duel. ZX81 £5.50. VIC20.£9.50. 16K.

PIXEL POWER At last it is easy to create your own custom characters on the 8K plus expanded VIC20. A graphics workshop packed with useful features like Create, Amend, Save, View Set. £9.50. Refreshes the pixels that other programmes can't reach. (See Pixel Power in action in Trader and Subspace Striker)

HARVESTER Reap your reward in the Boosterspice fields around the planet Delta. A cutthroat strategy game for 2 to 4 players for the unexpanded VIC20. £4.50.

BRAINSTORM The telepathic emissions of the friendly Psions can wreck a human brain. Can you get our three space explorers across a river of nasty goo without blowing their minds. Unexpanded VIC20. £4.50.

GUITARPIX 1 For the VIC20 owner who wants to play the guitar. The first of a series that shows how to tune the guitar and demonstrates some elementary chords. Unexpanded VIC20. £4.50.

Send SAE for more details.

Eric Deeson has an entertaining time checking out the latest batch of ZX-81 games.

MANY GALAXIAN ADDICTS will be very happy with Artic's version, a short, but satisfying, machine-code product. It is not outstandingly fast, so that means high scores with the owner's name come thick and fast.

Abersoft's machine-code invaders follows the standard routine closely, is adequately designed and speedy; surprisingly, though, Break is not masked.

A new Breakout-type arcade game for the ZX programmer, Blastout, recently appeared on the Planet Software label. The control keys are Z and X — not a good choice, but the game is fast, with a reasonable attempt at making Sinclair graphics represent Breakout colours.

The first ZX Phoenix has appeared in the guise of Work Force's Winged Avenger. The copy reviewed was pre-production and it took a while to work out which keys to press, but this prototype has great promise — look out for the real thing. Asteroids is a popular arcade

game which ZX writers are strangely reticent in tackling. Silversoft is one of the few to attempt the game. The result, Meteor, is a trifle pricey at £5.95, but is a fully-fledged implementation.

Now for the Pac-Man-style batch. It is hard to do justice to them all — there are four close copies, plus the unusual Gulp from Campbell Systems. Its menu includes excellent instructions, and a choice of maze and speeds. There is only one gulper but one is quite enough. The four others include Zuckman by DJL Software, Zedman by Babtech, Mazeman by Abersoft, and Artic's Gobbleman.

The steady flow of Adventures for the ZX-81 all have the same basic skeleton: a quest for something, barriers to overcome, a track to find and fights to fight. Some scroll, as opposed to giving the rather dreary standard

print and display. Non-graphic Adventures are now becoming thin on the ground. Even the collection of three from Phipps includes simple little map fragments. Although in a different league from the fully graphic games, I like this cassette — three classic adventure scenarios for £5 seems reasonable.

Well documented

Sorcery from Saxon Computing, is a well-documented Adventure set in Arthurian Britain. Although I liked it, I found it remarkably unpolished in a number of ways and there was one serious bug: on being confronted by a cliff-face, I moved east and was mysteriously transported into a totally different scenario.

Moving on to look at adventures with pictures, I was particularly taken by Mazogs from Bug-Byte; the name is a compound of maze and trogs. The graphics are impressive, consisting of a two-dimensional maze in which you control a running figure, looking for a sparkling silver bar. The Mazogs are monsters patrolling the maze — wonderful black elves who have to be seen, with rubbed eyes, to be believed.

Assistance comes in the form of a sword with which to clear the way; the maze walls also enclose prisoners who can give you directions to the treasure. Of course when you do find the treasure, you have to escape from the maze — and with the treasure you cannot carry a sword.

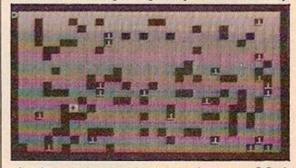

That particular maze game is certainly a hard one to follow, but Doric Computer Services' Oracle's Cave is a well-executed, though somewhat slow, fully-graphic adventure game, for one or two players. There is a choice of quests and the status of each player is continuously displayed. Apart from some grammatical lapses and the lack of indication of your current position on map, this remains an extremely competent product.

Scout from Deltasoft, an impressive German ZX Software house, is an ingenious mixture of

18

Missile Command and Fighter. It comes with nine neat key overlays and an excellent booklet, whose English puts many U.K. suppliers to shame. During the game you must destroy

the 27 attackers without running out of fuel, oxygen, ammunition or shields. The three-dimensional graphics and other little tricks makes this a game which you will enjoy for a long time.

Several three-dimensional mazes have appeared lately. Apart from J K Greye's archetypal Monster Maze, Planet Software's version is perhaps the most impressive. Excellent graphics mixed with nice touches of humour and a turn of speed make a worthwhile combination.

A standard type of graphic adventure is Damsel and the Beast from Bug-Byte. This is not one of the company's best — a purely Basic product with no written or internal instructions and no zip at all.

Quite the opposite is 3-D Defender from J K Greye. This is his fifth Gamestape and it is comparable to Monster Maze. This new product is just as innovative as standard Defender, but your view is from the cockpit rather than from the ground. A display of instruments is shown, together with the sky and approaching fliers. Key layout is good; there is a choice of keys for each function. 3-D Defender demands a lot of skill.

Perhaps most original of all the new graphics adventures is Newsoft's Time Bandits. The

source of the idea is obvious from the title; the real novelty is in the thoughtful implementation. On side A you have the chance to practise any of the five sub-games. When you graduate to side B, you experience the entire gamut in one game.

Aquarius Software has added another Star Trek to the several that already exist. Unoriginal and rather slow - being pure Basic - this program is cheap and does follow the well-defined rules. Much more interesting is Cosmos from Vortex Software. This is the pick of the company's batch, and a splendid machine-coded combat it is. You dart around space defending a convoy from alien spacecraft. Controls, once mastered, are good, and so are the score displays.

Remaining in orbit, Richard Shepherd's Space Mission provides great competition. The graphics for this space combat are spectacular, and the program shows great attention to detail. There are seven skill levels.

A simulation is a serious gaming product which tries to mirror some aspect of real life and perhaps even teach concepts or skills. One example of this is Football Manager from Addictive Games.

Management heavy

In this you play the role of a management heavy, buying and selling players, borrowing money, playing league games and generally enjoying the hurly-burly of screen life. A cunning tension-building device is the newsflash display which keeps you up to date on how your team is doing in a match.

Microcomputer flight simulations are becoming commonplace. A great one from a newcomer to the ZX scene, Digital Integration, is Fighter Pilot. Partly machine-coded and relatively fast, this game allows you to choose to practise landings or to attempt a full take-off, circuit, landing sequence. All this is pure instrument flying - 10 displays to watch and eight controls.

Night Gunner, another cassette from the same company, put you in the control seat of a rear gun, with targets weaving around in the night sky.

One company apparently going all out in the simulations direction is Cases' Computer Simulations. It has two products of the computerised board-game type, Autochef - in which you have to build up a fast food empire, and Airline - in which you emulate Freddie Laker.

Class of its own

In a class of its own is a new ZX chess, from Abersoft. This is extremely easy to use, plays very well and has seven levels giving black and white choice plus offering Copy. It is, in my opinion, the first piece of software to succeed in representing chess pieces with Sinclair graphics.

Michael Orwin's Cassettes 3 and 4 each have eight reasonably lengthy 16K games for £5. These contain a good blend: Adventure games, Invader-style material, serious games like Life and less serious ones like Oxo. Orwin's own name appears as author for only one of the 16 games - Fungaloids - but it is the pick of the bunch, a cross between Defender and Triffids.

Richard Shepherd's Bargain Bytes appeared in April, claiming to be first of a series, although further collections have been tardy in appearing. At £5 for eight 16K programs, each recorded once, this seems to be direct competition for Orwin. The games - fine as far as they go in stolid, uninspired Basic - are, however, hardly novel. There is a Hangman, a Mastermind, a Depthcharge, and two Adventures, one undersea, the other underground. The Adventures are Shepherd's main games on this cassette; they follow the usual format and tend to be rather slow, but this does not seriously detract from Adventure games.

John Prince has tried to go one better with his Astro-Invaders collection, but the Invaders tself is rather strange - it takes a while to figure out the controls, which turn out to be a trifle slow-acting. Some of the effects are quite nice, but there are many better implementations around. Prince's makeweights on the £3.65 cassette are better, even if not original -Grand Prix, Penalty, Golf and Swat.

CONCLUSIONS

- The ZX-81 software market continues to be a very difficult one. Roughly 1,000 cassettes are available for this machine in Britain alone.
- There is a tendency for prices to fall and quality to rise, but slowly.
- Of course, there are some superb ZX games around now - but there is a whole load of rubbish riding on their backs, sometimes even from the same suppliers. Let the buyer beware.

CLIVE SINCLAIR: WHATEVER NEXIS

One name is stamped indelibly on most British computers — Sinclair. Now Meirion Jones finds out what else Clive has in store.

CLIVE SINCLAIR epitomises all that is best in British industry - or at least people in high places think so. When Margaret Thatcher presented the Japanese Prime Minister with the latest Sinclair machine in front of a television audience of hundreds of millions, many must have been delighted at this demonstration of Britain outdoing the Japanese in high-technology consumer goods.

Others who, after four months, were still waiting for their Spectrums to be delivered or whose machines had proved unreliable on arrival may have viewed the spectacle with less enthusiasm. But love him or loathe him, no-one can deny Sinclair's pre-eminence in silicon Britain or his startling record of technological innovation. In the early 1970s he produced the world's first pocket calculator and followed it up with the Black Watch - the first to have all its electronics on one

He opened this decade with the ZX-80, the first mass-produced home computer and soon followed it up with the ZX-81 and Spectrum, selling 500,000 computers in three

Now Clive Sinclair has become as synonymous with computers as Hoover is with vacuum cleaners. Yet unfortunately Sinclair's ventures have not always been as successful as expected. His calculator was soon overwhelmed by competition from the Far East and his digital watch had to be withdrawn because of unreliability and delivery delays, leaving the field clear for the Japanese.

Partly in response to these tribulations he has developed an unusual way of working. Despite a turnover of £30 million a year and rising, he employs just 50 people who concentrate on research, development and marketing while he farms out production of his proven inventions: "We're a nexus; we cause things to happen then stand back." With customers grumbling about delivery delays and a Japanese computer invasion on the cards can

Clive Sinclair stop history repeating itself?

"That's a long time ago in a different business. Several Japanese companies have launched personal computers and then pulled them out. Time and again they have failed; they are out because they can't get in. We make more computers than the whole of Japan. As long as our volume is at least as high as theirs - and it is a great deal higher - I don't see how they can compete. They can't do it at a low price".

If the Japanese cannot do it, how about Binatone's computer with 16K colour and sound for £50 to be

'We make more computers than Japan'

launched in January? - "I'll believe it when I see it. Binatone wouldn't know how to design the thing and we don't know of anyone in the Far East who could do it for them."

Sinclair's £125 Spectrum has become the standard by which other micros are judged: — "We started with the ZX-81, where people wanted something extra - a movingkey keyboard, colour and sound and a larger internal memory. The Spectrum was a solution to that.' While the 16K of RAM and quality of colour were an instant success, the keyboard was criticised for its lack of a full-size space bar and for what one rival called the "dead-flesh" feel of the keys.

"People who've actually used the

keyboard find it very attractive. It's not the same as other people's. It's our own design, low cost to produce but very satisfactory." But even Sinclair has to concede that it does not make word processing easy: "The keyboard may be a limitation but you could put another keyboard on it if you were really that desperate."

The success of the Spectrum has brought its own problems. Hundreds of Sinclair customers have written to or telephoned Your Computer to complain about delivery delays. "They're entitled to complain and we don't take it lightly. We did get things wrong but we've moved heaven and earth to correct it - the criticisms are justified and we'll make damn sure it doesn't happen again."

What angered customers most was Sinclair's failure to give realistic delivery dates and the lack of information about problems with the Spectrum's printed circuit board and power pack which have since been solved.

Sinclair prefers to interpret the delays as a back-handed compliment to the Spectrum. "Yet again, we've been amazed by the demand. It's not that we don't learn, it's just that this time we deliberately didn't advertise in the national press to start with in order to restrain demand.

"Nonetheless sales of the Spectrum have been just as high as with the ZX-81 which we advertised nationally despite the fact that it is more expensive. In addition we've been behind schedule but we're on schedule now and catching up rapidly."

Clive has little time to read micro magazines: "There are so many that I only have time to glance at them" but he had read September's Your

'They're entitled to complain and we don't take it lightly'

Computer interview with Hermann Hauser of Acorn with more than passing interest.

Ever since the BBC chose Acorn rather than Sinclair to produce the BBC Micro, the Cambridge air has been suitably blue with allegations and counter-allegations between the rival firms. Sinclair is particularly scathing about Hauser's claims for the Electron, Acorn's Spectrum challenger due to be launched next

month: "The Electron isn't here for a start - not expected by them until the end of the year - and not by anybody wise until next year. It will come out a year later than the Spectrum and will be way behind it in technology.

"It will have - as Hauser says more RAM, more ROM, more ULA, for the simple reason that in my view they don't know how to produce a machine half as well as we do. Ours isn't complex if you mean it has fewer chips - but that of course is the clever bit about it. It takes them 32K of ROM to do the interpreter and so on, which we do in 16K: they need 32K RAM minimum because their display takes 20K to do exactly the same as our display does in 8K. It's going to be much more expensive to make than the Spectrum and it only does the same job - in some ways not as well.

"They were announcing it at the same time as we were announcing the Spectrum - by the time it does appear I'm afraid the competition will be so fierce in that sector of the market that I think it will be too late. Hauser says that if he does have a problem, he just picks up the telephone. Well, we don't - we do it all in-house."

Sinclair is no less damming about the BBC machine. "If it wasn't for the fact that the BBC for their strange reasons allow Acorn to stick a BBC logo on their machines I don't think they would sell many computers. Hauser says it's an Apple and Pet competitor. Those machines were designed a long time ago and the Spectrum far exceeds their specification - and so it should, it's up to date."

Hauser's claim that BBC Basic is becoming the standard particularly offends Sinclair's sensibilities: "Sinclair Basic is the most widely used in the world today - by the end of this year half the computers produced in the world will have our Basic on them — if that's not a standard what the hell is?" Sinclair freely admits that his Basic may not be suitable for all applications but than restructuring his Basic lieves in "Horses for courses. We will offer a whole range of languages for the Spectrum."

Sinclair damns his other competitors with faint praise. "Commodore is a very effective company but technically way behind. Then again, Commodore makes many machines we don't have anything to compete with." He does not see He does not see Commodore's forthcoming Max as a threat either: "It's a games machine, that's all." As for the Dragon and purpose-built Spectrum-bashers like the Oric he will only say "Wait and

Next month Clive Sinclair takes the wraps off his most closely guarded secret, the Microdrive. If it is half as good a storage system as he claims, his competitors have much to fear. Until now if you wanted to use your machine to handle information you could either store the data on cassette and wait for hours when you needed it, while the computer found the right pieces of tape, or spend a small fortune on a 5.25in. disc-drive

'We have the flat screen, we have the Microdrive'

system and do the job properly.

Now the manufacturers are miniaturising the drives to take 3in. and 3.5in. discs and bringing prices down to size as well. Sony, Hitachi and BATS have all produced small drives which could be on sale for less than £200 by early next year, but once again Sinclair upstaged his rivals by announcing - last St George's Day - that he would release a 100K rapid-access storage system, the Microdrive, for £50.

Sinclair's reluctance to release any further details since April, together with the low price, has fuelled speculation that his micro-floppy might not be a real disc drive. Sinclair will only say "it will do exactly the same job as the other drives" and he is particularly indignant at Hermann Hauser's claim that the Microdrive will be obsolete before its launch.

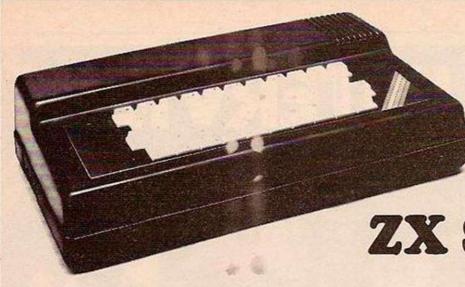

"The micro-floppy is the most important thing we're doing and contrary to what Hermann Hauser supposes it is actually well in advance of the 3in. and 3.5in. machines that the Japanese are doing and less expensive." As for access times: "They're all a sight faster than any customer is ever going to need, it'll do anything you want it to do. "The Japanese ones even for large volumes will retail at twice our price. I was talking with Adam Osborne about this and he wants to buy ours even though he can buy anywhere in the world".

Like Sinclair, Osborne was once an electronics writer before he started building the briefcase computers which now carry his name and which Sinclair admires. "That portability thing makes it very sexy but the true virtue of his machine is that it's all in one package. You don't have all those cords trailing about to plug together."

It comes as no surprise that Osborne is working on a less cumbersome successor to his present machine incorporating Microdrives. Could Sinclair be working on a lightweight briefcase machine himself?

He has spent 10 years perfecting (continued on page 41)

New From Fuller FD System for the

ZX SPECTRUM

£39.95

+ £2.50 p & p.

Professional Keyboard & Case —

This unit has the same high standard as our ZX81 unit.

Tough A.B.S. Plastic case encloses our Keyboard, the Spectrum Printed Circuit Board and the Power Supply.

Our own Power supply is available:- 9 volts DC at 2 amps. Mains either 110v or 240v AC at £5.95 + 80p. p & p.

The Keyboard has 42 keys with all the spectrum functions printed onto them, the full travel key switches have gold plated contacts and a guaranteed life of 10⁶ operations.

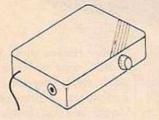

INSTALLATION - Simply unscrew the ZX printed circuit board from its case and screw it into the FD case, plug in the keyboard and that's it. No technical know how or soldering required, the built unit is tested and comes with a money back guarantee.

Spectrum Keyboard and Case Kit £33.95

Our Mother Board for the spectrum has 2 slots at £15.95 or 3 slots at £19.95, this unit also fixes inside the case. p & p 80p.

SPECTRUM SOUND AMPLIFIER £5.95 + 80p p & p.

Complete with leads, volume control and loud speaker in tough ABS Plastic case measuring 5" x 3" x 1" just plugs into your spectrum MIC input.

First Anniversary Offer

The FD System is now one year old and Fuller are celebrating with this amazing offer on the FD42 Professional Keyboard and Case.

Makes an ideal Christmas present to expand the new low priced Sinclair ZX81. Or why not buy a new ZX81 based system directly from us, consisting of ZX81, FD42 keyboard and case with power supply and reset switch, leads and manual £69.95 + £2.50 p & p

FD42 Keyboard and Case Kit £24.95 + £2.50 p & p FD42 Keyboard kit £14.95-80p p & p + £2.50 p & p

£29.95

STAR TREK FOR ZX 16K SPECTRUM

Play this popular adventure game on your Spectrum with ship display and sound £5.00 + 50p p & p

(continued from page 39)

the flat-screen television and now has the Microdrive. Both are likely to find a place in next year's new Sinclair, which will not be called the

"That's a likely product. We have the flat-screen technology, we have the Microdrive technology. Late next year we'll have a machine which is not a replacement for anything we have now, and which will have the display and the drives. It is for that reason that I don't think our opposition stands a heck of a chance - because we can do that and nobody else can. Obviously it is going to cost a lot more than the Spectrum."

Next year's model should also step straight into the era of electronic mail. It will incorporate Sinclair's telephone Modem which will become available as a Spectrum addon early next year for about £50. "When you're linked to the telephone you can send a message from one computer to another, so you've got electronic mail."

The Modem will also allow Sinclair owners to access databases like Prestel and viewdata. Sinclair plans to use Prestel to sell programs. Sinclair owners will be able to download games programs from the telephone line. "It's a good way to sell software, the sort of thing we're doing will probably be a great boost for Prestel."

Sinclair seems confident that Prestel will at last make the longpredicted breakthrough, if only because he expects hundreds of thousands to buy Spectrums and Modems. "We won't get our fingers burnt at all because we're simply offering a facility." Sinclair believes that the size of this market may encourage others to set up their own databases: "Other companies will set them up - we're talking to them about it now."

Electronic mail may also extend the useful life of the ZX Printer, "From time to time you need hard copy either for electronic mail or for the data you're taking from the Post Office viewdata system. That's where our printer becomes so important."

He rejects criticisms that the printout on narrow aluminised paper is

unsatisfactory: "We're not replacing it at all because that printer has the unique ability to do graphics very rapidly, to print out a complete screen of data in 12 seconds. No other machine can do that at anything remotely like the price."

Those who want typewriter quality print-outs will have to wait another year for a solution from Sinclair but, in the meantime, next month's release of the Sinclair RS-232 interface will make it easier to find a compatible printer.

"We are developing a plain-paper printer - not before the end of next year - but that's a full-size printer for letters, stationery, invoices, and things like that."

Sinclair is also working on a desktop executive machine for ICL which will incorporate many of the same ideas. "A couple of Microdrives, 7in. or 9 in. flat screen, an enhanced version of our Basic, and a telephone which links in.' Inside the ICL will be an expanded Spectrum and the machines could be networked together or communicate over the telephone.

"It will replace the paper that moves around at the moment An executive can send data to anyone

'That's what a telephone is going to look like'

else in the net, receive messages on it, and his mail will come through there. It will be arranged so that somebody who doesn't know anything about computers can use it - just get a menu up on screen and select. The price will be pretty modest because we have the best technology - otherwise ICL wouldn't be coming to us.'

Tony Baden of Bug-Byte believes that every home will have a home computer by the end of next year -Sinclair is slightly more cautious: "We can't make them that fast, but there will be millions, because" he points to an artist's impression of the ICL machine "that's what a telephone is going to look like one of these days. Very few will sit down to program them but people will need the facilities, like electronic mail, that it offers.

Among the other facilities Sinclair expects to offer by 1984 are expert systems giving individual tuition to children and medical advice to the family. Could the Spectrum be adapted to do this? "Perhaps the Spectrum - certainly son of Spectrum. I think the home doctor is the application we'll tackle first that's the vital one. We'll get to the point where we have expert systems linked into teaching, offering infinite patience and infinite attention."

Cynics might suspect that a government might use this as an excuse to do away with the health and education services but Sinclair prefers to believe that "It will enable us to make better use of a scarce resource."

Sinclair is optimistic about our electronic future although he acknowledges that millions more will be thrown out of work by the new technology. "Computers are not going to suddenly and radically change our lives - they'll gradually improve them. The only way in which there can be new jobs is by

hundreds of thousands of people starting different sorts of businesses in the service industries, in new technology and in the life sciences."

Sinclair believes that the writing is on the wall for the big corporations. Small businesses "will replace the megalithic companies - the vast employers of people." Ironically his own computers are made by Timex, an American-owned multi-national.

He believes that the information revolution could lead us into a new Golden Age of civilisation rivalling Augustinian Rome, Louis XIV's France or Elizabethan England. Hopefully life for the majority of people would not be as miserable in Clive's Golden Age as it was in the societies he admires.

Renaissance prince he may be, but Sinclair resisted the temptation to be photographed next to an imitation

'Enable us to make better use of a scarce resource'

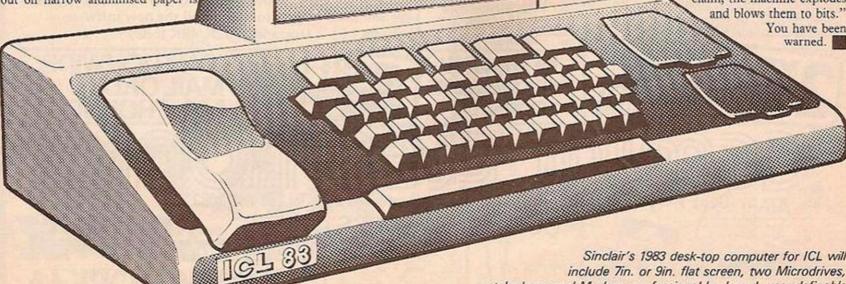

Greek statue on the balcony of his Chelsea service flat. "No, it's a horrible thing".

In such spare time as he has Sinclair is chairman of British Mensa, an organisation for people with high IQs. He laughs at the idea that there is anything sinister about the head of the world's largest homecomputer firm also being head of Mensa.

Contrary to popular belief Clive Sinclair does not have square eyes with little white squares in the bottom left-hand corners. He is a keen runner: "I run seven or eight miles every morning, clear my head, get rid of my hangover, and straighten out the day.'

So does he fear for the fitness of all those people pumping programs into their Sinclairs through the night? Could he find himself facing a million lawswuits from ZX owners claiming his computers have turned them into social hermits who can only communicate in machine code? "No", Sinclair smiles, "We program

them so that if they make a claim, the machine explodes and blows them to bits."

Sinclair's 1983 desk-top computer for ICL will include 7in. or 9in. flat screen, two Microdrives, a telephone and Modem, professional keyboard, user-definable keys and Son of Spectrum insides. Your Computer artist's impression.

SOFTWARE SUPERMARKET

YOUR ONE-STOP SHOP FOR THE BEST ZX81 PROGRAMS.

Now you can order the very best ZX81 programs with just one postage stamp. From the many tapes available, we've selected the ones that stretch your ZX81, the ones you'll want to play again and again. Order now: we'll send them fast.

All games need a ZX81 with 16K Ram

- 1. ZUCKMAN "has all the addictive features of the original... fast and interesting game" - Sinclair User. The first and still the best ZX81 version. 4 ghosts, trail, energy posts, high-score Hall of Fame. All machine-code. £5.95 (DJL)
- 2. MAZOGS "Great... a superb concept". PCW. Such good graphics you'll really believe you're running through the maze, sword in hand, killing mazogs. As you get better, the game gets harder. Very addictive. £8.00 (Bug Byte).
- 3. TRADER "Outstanding graphics... original and entertaining" Sinclair User. Travel around 6 planets as this 48K game loads in 3 x 16K chapters. Starts with 25-second Test load. Beautiful pictures to show off your ZX81. £10.50 (Pixel).
- 4. FROGGER First time on ZX81. A very exciting version of the arcade game. Enchanting graphic frogs in their frog-homes. Moving cars, logs, diving turtles, alligators - and watch out for the snake on the bank. On-screen scoring, hi-score, timing. All machine code. £5.95 (DJL).
- 5. ALIEN INTRUDER Based on the film 'Alien'. Pit your wits against the savage monster that ate the crew of your starship. Will you make it to the Shuttle? Will the Alien, too? "Suitably frightening" - PCW. HIEROGLYPHICS on Side 2, a word game -"Shrieks of delight from the kids" - PCW. £4.95 (Carnell).
- 6. ASTEROIDS "Take your ZX81 where no Sinclair has gone before" C&VG. "Good all-machine code version of the original" - Sinclair User. 3 sizes of asteroids attack you, left and right turn, fire, thrust and a great swivel action. 10 play levels. On-screen scoring and hi-score. £5.95 (Silversoft).
- 7. ORACLE'S CAVE Facinating adventure game with helpful graphics. For 1 or 2 players. Follow your chosen quest but watch out for the monsters: can you keep your strength up to meet the oracle? Hours of pleasure. £6.95 (Doric).
- 8. THE ZX ARCADE PACK Brilliant collection of fast-moving arcade games. "The graphics are excellent, the speed is incredible... excellent... addictive... better than any other ... " - ZX Computing: Invaders, Galazians, plus 6 more games, including a great 1 or 2 player graphic gunfight. £4.95 (Control Technology).
- 9. SUBSPACE STRIKER You are captain of the spaceship Swordfish, lurking in hyperspace, waiting to kill the enemy fleet with your Antimat torpedoes. "Some splendid graphics of the various spaceships... especially good destruction sequence" - Sinclair User. £5.50 (Pixel).
- 10. ZX OTHELLO "Recommended without reserve... a superb opponent" -Your Computer. The best and latest (version 3.5) of this classic game makes Reversi as challenging as chess. 9 play levels. £6.95 (M of I).

ORDER NOW - AND WE'LL SEND DETAILS OF HOW TO GET A £4.95 PROGRAM OF YOUR CHOICE, ABSOLUTELY FREE!

Can you stay on the road? Dirk Lampe's Vic-20 program tests your skills to the limit.

THIS PROGRAM is similar to the popular arcade game Nightdriver. The aim is to steer a racing car along an intricately winding road in the dark. But this program also tries to increase the competition by allowing more than one driver to compete in the race. Each driver races after the previous one has completed the course, the winner eventually being the one to finish in the fastest time.

This program was written on a Vic-20 expanded by 3K, and occupies about 4,300 bytes, but it can be squeezed into an unexpanded Vic with some rearrangement. Machine-code subroutines are Poked into memory locations near the top of the Vic's RAM at locations 6000, 6100, 6200 and 6300 in lines 10 to 190. The first subroutine draws the left side of the road, and the second the right side. The third and fourth erase the left and right sides of the road respectively.

These machine-code programs are accessed in lines 1000 to 1030 using the Vic Basic SYS command which is similar to USR on many other versions. The data is stored in locations zero and one of memory and calculated in lines 1040 to 1250.

The rest of the program — all written in Basic — starts at line 190. Lines 190 to 193 ask whether instructions are needed, and wait for the operator to press either Y or N. If Y is pressed, it then jumps to the subroutine from 2200 to 2280 which displays the instructions on the screen. As can be seen from the instructions, either a joystick or the keyboard can be used to control your car and the routine to read the joystick is situated at line numbers 2000 to 2040. In order to read the joystick the keyboard must be temporarily disabled by Poke 37154,127. It is important that you reenable the keyboard with a Poke 37154,255 in line 2040.

Lines 200 to 301 deal with the preparations for the program and set up certain parameters like screen colour, auto-repeat on all keys, keyboard-buffer length as well as disabling the character-set switching ability, setting the position of the character set in memory and also turning off any superfluous sound.

Location 36867 controls the number of rows on the Vic screen and line 210 sets this to 46 over 2, that is 23.

Lines 220 to 260 draw a colourful title on the screen. Lines 270 to 301 then ask for the required skill level: the lower this is, the harder it is to negotiate corners; the higher, the easier. Desired course length and number of players are also requested at the same time.

The race then starts at line 305, a loop in which eight plus-signs are Poked on to the screen at line 380, representing the car bonnet. Lines 390 to 440 then move the road according to the car's movement. The keyboard buffer is scanned and the joystick read while line 450 halts the program for a time dependent on the speed of the car — top speed 255 km/h. Lines 460 to 470 produce the sound of the car engine and 480 increases the distance travelled. If you drive for one hour at 60 km/h you will,

unsurprisingly, cover a total distance of 60km.

Line 530 checks if you are driving off the road. If you are, it jumps to the subroutine making you move further off the road for a random number of times. If you are not driving off the road, line 540 decides whether the road ahead should be left-curved, right-curved or straight. Line 550 checks to see if you have crashed by looking to see whether the plus-signs have been erased by the road. If they have, it makes an explosion. From there to line 600 the program returns back to line 375 unless the finishing line has been crossed or the car crashed more than five times.

In this case, the program moves to lines 3000 to the End. In this, the driver's time is displayed. If there are still more contenders, it then returns to the start of the race track for the next driver. If the driver was the last contender, the competitors' results are once again displayed.

To fit the program into an unexpanded Vic's memory, first write lines 10 to 100 leaving out

REM DRAW ROAD.

all the Rem statements. Then change the Poke addresses as shown.

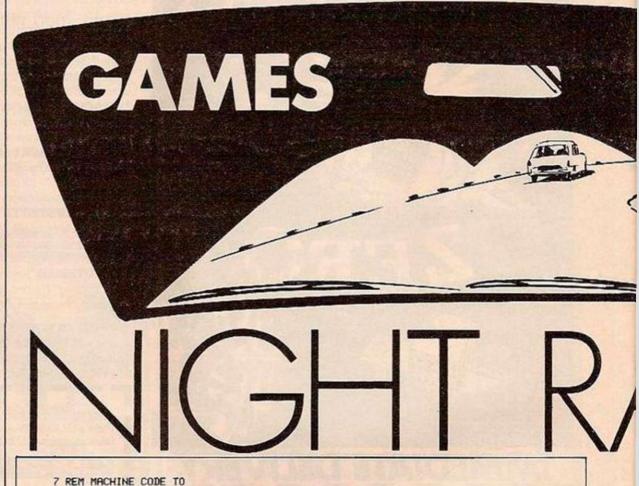

Line	New address
10	6800 + S
40	6830 + S
60	6860 + S
90	6890+S

Change the last few items in the Data statements of the following lines to the new numbers given — in each case, the numbers to be changed are those following the number 76.

Line	Old	New
30	112,23,£	144,26,£
50	212,23,£	174,26,£
80	56,24,£	204,26,£
100	156,24,£	234,26,£

Next, Save the program on tape, then write the rest of the program as listed, leaving out the following sections and any Rem statements that might turn up: lines 101-260 inclusive, and lines 1999-2280.

In line 390 delete the Gosub 2000; in lines 1000-1030 change the SYS addresses to 6800, 6830, 6860, 6890 respectively, from what they

were previously — 6000, 6100, 6200, 6300 — and in line 260 type Poke 650,128. Now, Save the program after the first part.

The loading procedure for the unexpanded Vic program is as follows: wind the tape to wherever the first program is stored and then type Load, and when the program has loaded, Run followed by New and Load again. The game is then loaded.

This an an assembled version of the machine-language subroutine starting at 6000 (or 6800):

CLC LDY#0
LDA 0 STA (0),Y
SBC#22 SBC#22
BCS 1 STA 0

RTS JMP 6000 or 6800 CLC on the unexpanded Vic. LDA#78

A joystick cannot be used on an unexpanded Vic.

The other machine-code subroutines are almost identical. All are written in 6502 machine code.

4CER

Vic-20 addresses.

1024-7679 RAM, for programs, on expanded Vic

4096-7679 on unexpanded

7680-8185 screen memory

36879 screen/border colours

36878 volume of sound

36874-36877 sound speaker channels, value >128 and sound emits from appropriate speaker.

650 key repeat (>128 and all keys repeat)

649 length of keyboard buffer

657 disable switching keys

36869 location of character generator in memory, if 240 then in ROM 32768 0,1 zero page RAM — usually not used by Vic's OS

36867 rows on Vic screen (×2)

37152, 37137, 37154 Vic user port for joystick

The above addresses in the Vic would need to be changed for conversion to other systems.

The high-resolution graphics capabilities of the Dragon 32 are excellent, but the manual suggests that the best way to produce a picture on the screen is to resort to a pencil and a highresolution grid. The standard graphics commands and the manual give you a high degree of control over drawing highresolution pictures but need to be planned carefully. Keith and Steven Brain's drawing program allows you to take advantage of the Dragon's best graphics features while giving you the freedom of a true artist of the electronic screen. With the program you can paint and fill in areas of the screen as your creative drive demands.

PURISTS WILL ALWAYS insist that programs should be written away from the keyboard. The more spontaneous among us find direct drawing on to the screen preferable. This article deals with some of the difficulties which have to be tackled to enable this on the Dragon.

Curves and colour

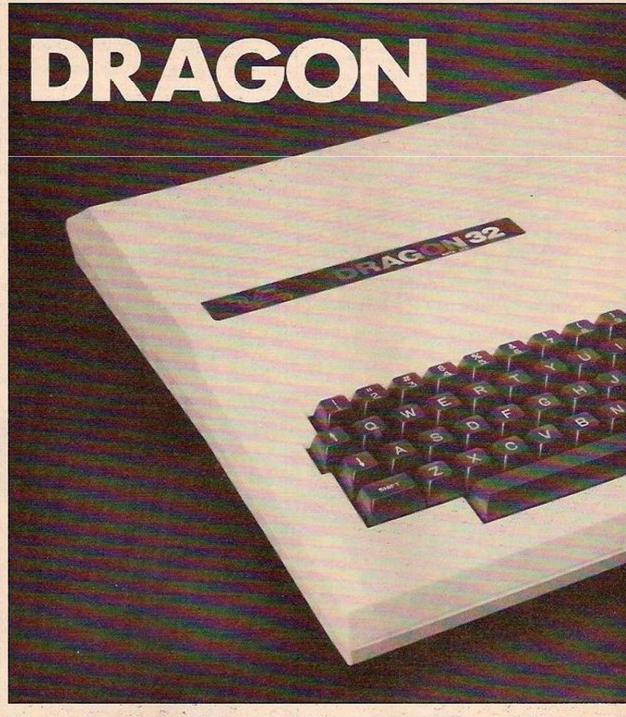

The first problem encountered is the inability to Print on the high-resolution screen or to make inputs in high-resolution mode, but fortunately these problems can be overcome via the Inkey\$ function. Although the Line and Circle commands require specification of start and end co-ordinates, the Draw command is much more lenient and is easily accessed via

The default value for any of the standard draw commands, Up, Down, Right, Left, E, F, G, and H Diagonal is one scale unit. Therefore these can be called by a single Inkey\$ character, to give a single scale to be achieved by the following simple subroutine:

20 A\$ = INKEY\$ 30 IF INKEY\$ = "" THEN 20 100 DRAW A\$

Curves can be constructed by judicious use of these keys at the minimum Scale setting.

The fundamental Scale unit must be defined at the start of the program, together with the

PMode and Screen type, but Scale can also be varied during execution by means of the S key and evaluation of A\$. Depression of this key can be made to increase the value of the Scale unit thus:

10 PMODE = 3,1: SCREEN = 1,0: S = 4 40 IF INKEY\$ = "S" THEN S = S + 2 50 DRAW "S" + STR\$(S)

Another key can be used to reduce or reset the Scale to the original value and thus one key gives a wide range of Scale factors.

Colour can be reached similarly by checking if the Inkey\$ function is a numeral whose Val can be used to set the subsequent Draw colour, by examining the ASCII value in the new line 100.

60 A = ASC(A\$)100 IF A>47 AND A<57 THEN C\$ = A\$ **ELSE DRAW A\$**

Blank moves can be made by Drawing in the background colour, and these moves can also be used to erase unwanted parts of the picture. Any permitted Colour for the selected PMode can be called.

To aid composition, a flashing cursor can be provided to indicate the current Draw position. It does this by rapidly Drawing in a visible Colour and then Drawing in the reverse direction in the background Colour.

30 IF A\$ = "" THEN DRAW "S1C1R1COL1": GOTO 30 Further assistance can be provided via the Sound function. An audible feedback can be provided for each type of key depression: different tones can be constructed around middle C - 89 - from the ASC value of the Inkey\$ string.

110 SOUND (89 + ASC(A\$)), 2: GOTO 30

For the final touch, more colour can be added to the screen via Paint. This is reached through P, returning the screen to lowresolution and requesting the co-ordinates and colour information to be added. As the highresolution screen is not cleared, return from this subroutine to high-resolution reveals Painting in progress, and further Drawing can also take place.

70 IF A\$ = "P" THEN GOTO 200

Having composed a masterpiece worthy of Rembrandt or Picasso, one obviously would like to retain this for posterity.

Although the Get command allows storage of screen information in an array, it cannot be used to store the entire screen due to memory limitations. Each screen would require the setting up of an array of 256 * 192 units more than 48K. A more conservative alternative was suggested by examination of the Dragon memory map which revealed that the first four Pages of high-resolution RAM lie between 1536 and 7679. A subroutine which Peeks the values in these locations and Loads them into an array can therefore store the same information in much more compact form, about 6K.

Cut access time

For more permanent storage, this array can be put on to a cassette as a data file. Whilst this approach does work it is rather slow as a 6Klong data file takes over five minutes to load.

This problem can be easily circumvented by use of the CSaveM and CLoadM commands to Save and Load the contents of highresolution graphics pages as a machine-code file. This reduces the access time to only 20 percent of that required for a data file and makes storage of detailed freehand pictures

A complete program for real-time on-screen drawing based on these principles is given in figure 1. This is rather more complex and incorporates a number of devices to make it more user-friendly.

Program devices

Line 20 includes B\$ which contains a list of all permitted keys, and X\$ which lists the number of high-resolution pages for each mode. Line 30 requests the PMode and Screen parameters to be used, and sets the default Scale value to four. Line 40 uses string-slicing to set PG to the appropriate value for the number of pages required.

Line 50 sets up the high-resolution display, and moves the cursor to the top left-hand corner. Line 60 checks for instructions and, if there are none, flashes the cursor.

Line 70 uses the Instr function to check whether an incorrect key has been depressed, and if so sounds a raspberry.

Line 80 sets the Scale and Colour parameters for each movement. Line 90 checks whether an increase in Scale is required, and line 100 resets Scale to the default value.

Line 110 checks for "C" for clearing the screen. After a few accidental disasters this requires confirmation of action via the subroutine at 260 which requires an Input.

Line 120 checks for "P" and leads to the Paint subroutine at 240, which allows blocks of colour to be added. Warning: watch out for pinholes in your pictures - the paint can spill through them with disastrous results.

Line 130 leads via i to the Save routine, and 140 via @ to the load routine. Both of these subroutines request a file name, and ask if the recorder is ready.

To avoid recognition of taped machine-code files when making a directory, an M is added to the selected file name. The Save routine displays that Saving is in progress, and that Saving has been completed. As the highresolution screen is set up before activation of the CLoadM, the result is an impressive buildup of the complete picture from the top of the screen as loading progressess.

Line 150 is the default which checks if Inkey\$ is a number and, if so, alters the Colour value, or Else draws U, D, L, R, E, F, G or H - all one-scale units. If background Colour is selected then obviously a blank move is achieved.

Line 160 makes a sound related to the ASCII value of Inkey\$ to confirm the selected move, and returns to the keyboard-scanning

Figure 2 is a simple program which builds up a display of blocks of colour on the screen. As each randomly-chosen block of colour appears in a random position on the screen, a note sounds. The notes are high if the block appears towards the top of the screen and low towards the bottom. The program is not particularly sophisticated but it does indicate how easy it can be to create a background display or conversation piece perhaps for a party.

Figure 1.

SPECTRUM GRAPHICS SUPERDRAW16 16K ZX SPECTRUM GRAPHICS

- 16K Spectrum graphics pack.
- Full screen high resolution colour.
- Moving cursor control.
- Large alphabet facility.
- Pictures saved on cassette.
- Automatic "slide show" option.
- Menu driven, easy to operate, crash proofed.
- Documented to usual high Video Software standard.
- Demonstration slide show.
- Audio commentary on reverse of cassette.

If you've now got your Spectrum you will be wanting to explore its graphics potential. SUPERDRAW16 will help you get the best from it.

Price: £5.00 inc. VAT, P. & P. Immediate delivery.

Software for the Home Computer
From M.E. Evans the author of:-

3D MONSTER MAZE DEFENDER

comes a game for the

For the ZX81
SPECTRUM

ESCAPE

Can you find the axe to break down the exit door of the maze and ESPACE? The maze is inhabited by 5 hunting dinosaurs including a TRICERATOPS who has the habit of hiding behind the hedges, and a PTERANODON that soars over the maze to swoop down on you.

H&H SOFTWARE

Software for the BBC Computer

Model B only

ALPHABETA A complete Word Processing Package with instantaneous response. Features include automatic wrapround, insert, delete, over-write, title centring, tabs, merging and other editing facilities. Up to 224 lines of 80 characters can be produced. For longer documents editing between files is possible. Price includes a manual and labels for the red keys.......£28.50

TESS A program for graphic designers or one just for fun.

Tesselations are shapes that fit together leaving no gaps. You start by drawing a shape and the computer makes sure it will tesselate.

When you're ready, fill the screen with many copies of the shape in a variety of colours, patterns and sizes. Animations are possible too, the tape includes an example.

£8.50

Model A or B (Family games with sound and colour)

SHAPE and RACE For 6 year olds upwards. In SHAPE, a tracer bounces inside a blue box and rebounds off a hidden shape. Can you identify the shape before your opponent. The RACE is between a hare and a tortoise. First one to the flowers wins......£5.50

Prices include cased cassette, instructions, postage etc.
Please send orders and cheques/PO/Transcash (No. 614 131 707)

H&H, Dept A, 53 HOLLOWAY, RUNCORN, CHESHIRE.

> and a wide range of independent SOFTWARE

Main Computer Branches:

22 OXFORD STREET, London W.1. 439 OXFORD STREET, London W.1. 52 WESTERN ROAD, BRIGHTON.

Also at:

184 REGENT STREET, London W.1. 254 REGENT STREET, London W.1. PRESENTING THE NEW.

KEMPSTON (Micro) ELECTRONICS ZX SPECTRUM HARDWARE

We are proud to announce that we have developed for the ZX SPECTRUM a new 24 line programmable peripheral Interface using MOS technology with the following features: -

- 3×8bit ports
- Port mapped, using IN and OUT commands
- I/O via 16 pin DIL sockets
 I/O also via 28 way edge connector
- Can be used in BASIC or Machine Code

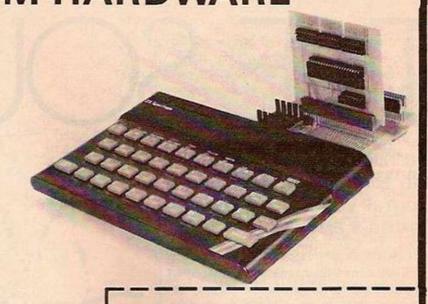

The port is available fully built with a detailed set of instructions and control applications. The port can either be used with out motherboard, thus allowing a further card to be used, or with a stackable connector. Either way, it means that Micro-Drives, Printers, etc., can still be used with the port.

Please note that this is DEFINITELY NOT a ZX81 MODIFICATION but an exclusive design for the new ZX Spectrum.

ZX Spectrum PPI port. £16.50 ZX 2 slot Motherboard......f16.95 ZX Stackable connector.....£ 5.50

All prices inclusive of VAT, but postage must be added at 70 pence for a single item, 100 pence for 2 or more items. Available by mail order only. Cheques, P.O's made payable to:

KEMPSTON (Micro) Electronics 60 Adamson Court, Hillgrounds Road, Kempston, Bedford MK42 8OZ. Please allow 21 days for delivery. S.A.E. in all correspondence.

MUSIC

THE SOUND (

The hills could be alive with the sound of your Atom if you take David Morton's advice.

MOST MICROCOMPUTERS can make noises, though sometimes their range is limited. Apart from sound effects for games this capacity has an obvious application in music production. However, if you, like me, are completely unmusical you will not have been able to make the best use of the variety of programs allowing you to compose, play and store music. Why not use the computer to compose and play short melodies?

A computer can compose tunes by basing its

composition on a pattern of established music. This is done by taking a piece of music, splitting it into bars and storing them in memory. Bars can then be selected at random and joined together to form flowing music.

The disadvantage of this method is the large amount of storage needed. Another approach is to analyse examples of a composer's work statistically, and this is the approach covered

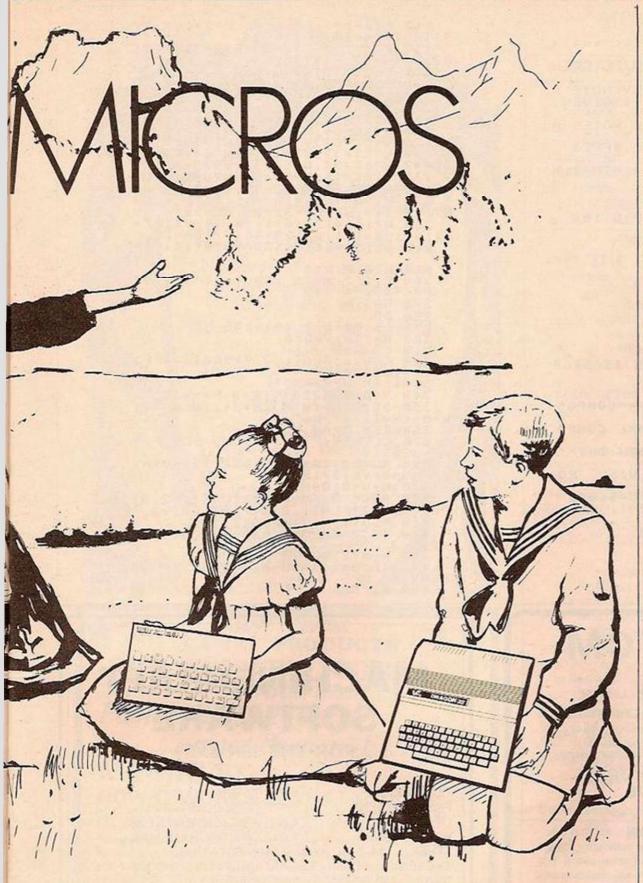

here. The programs are written for an Acorn Atom, but are easily modified for other computers with sound-generation facilities.

It is simple to count how many times a particular note occurs, but this is not much use for composition unless the number of times a particular note follows any other note is counted. It is then possible to calculate, given a note, the probability that any other note will follow it. If a table of such probabilities is built up, a fingerprint is provided on which the computer can base its composition. This fingerprint is different for each composer.

The first program produces this table of probabilities, but requires some time to enter a substantial number of notes at the keyboard. I have therefore given the results from two runs of the program on different composers. For simplicity, and because of the limit on storage space, I have confined the analysis to 12 notes and ignored the duration of each note. The notes are entered as the numbers 1-12 representing the notes as indicated in figure 1.

Each analysis should ideally be confined to the music of one composer; a variation in style confuses the results. The program is simple. It

counts the number of times any note follows any other note, building up an array of 144 elements.

12	F	0	0	0	0	0	0	0	95	0	160	0	C

On completion of the data entry, indicated by entering an 0, this array is converted to an array of probabilities in which 255 represents certainty and 0 impossibility. The two tables of probabilities below were produced from about ten melodies each, the first by Strauss and the second by an American composer.

Each table can be stored in memory as an array - although I used the Atom's bytevectors to save space. In each table the last note to be played is represented in the extreme left column, and the probability of any note following it is represented by the members of that row. Thus, in the first example, the probability that the note C2 follows B1 is 141/255 and it is impossible for the note C9 to follow B1.

The second program uses the second table of probabilities to decide on a series of notes, playing and drawing them as it does so.

A range of notes

In this program, the subroutine between lines 330 and 350 decides on the next note to be played by choosing a random number between 1 and 255, and then looking along the appropriate row of the table. The members of that row are added together until the sum is greater than the random number. The note whose probability was last added to the sum is chosen as the new note, which is played and drawn on the screen.

The Atom's speaker is connected to Bit 2 of an output port and a tone is produced by Exclusive-Oring the port with 4. The speed at which this is done determines the frequency of the tone produced. The assembler routine at line 80 does this; it is an exact copy of the one from the Atom's manual.

The frequency is determined by the contents of the accumulator and the duration of the note by the Y-register. These are calculated by Basic before entering the machine-code routine at line 310.

The numbers representing the frequency of each note are stored in another array, and are calculated from the fact that the time between successive blips of the speaker is 5*x+17 cycles, which at 1 MHz is (5*x+17)*10-6 seconds. The value of x can therefore be easily found. The frequencies I used are listed below and are based on a middle C of 262 Hz.

Frequency Hz	×
988	199
1047	188
1174	167
1319	148
1397	140
	124
1760	110
1976	98
2093	92
2344	82
2637	72
2794	68
	988 1047 1174 1319 1397 1568 1760 1976 2093 2344 2637

The music produced by this program, although far from random, tends to lose structure over a long period of time. There is some scope for improvement. For example, it is possible to analyse three or more note sequences instead of two, or to take account of the length of notes. Much better results are obtained when a programmable sound generator, like the AY 38910, is used.

MEMIC-81 **HOW IT WORKS & WHAT IT DOES**

This useful accessory for ZX81 users is a 2 kilobyte (or 4KB) memory module using chips fabricated in a remarkable technology. When not actually in use, these CMOS chips can be put into standby. They then take only a minute current to retain the data securely. The Lithium battery fitted in the unit will last for 5 to 10 years. Plug it into the ZX81 and flick a switch and the data is ready for retrieval.

MEMIC-81 resides in the 8-12K area of ZX81's memory map. This area is not directly addressed by Basic, but Basic programs can easily be stored and retrieved by means of the tiny 12 byte routine provided. This can itself be stored in CMOS, so that Basic programs become available simply by entering PRINT USR . . . Machine Code routines are directly accessible.

Clear User Notes, Application Notes, Program Example and the necessary routines are provided with MEMIC-81, which comes

cased and with an extender card at the back. For a picture of MEMIC-81, see Sept Y.C. page 122.

C.J.E. Microcomputers

Dept (YC), 25 HENRY AVE, RUSTINGTON, W. SUSSEX BN16 2PA. (09062) 6647

THE BBC MICRO is one of the most impressive machines on the market, and its capabilities for music generation are much-praised.

That does not mean, however, that every BBC owner can immediately plug in and start emulating Gary Numan, though this article will show you how to take full advantage of the features that are present in the BBC's music

We will now define the initial problems you may encounter, and see what can be done to overcome them, so that our micros can start making pleasant noises.

There are two main hardware grumbles both easy to solve. Most BBC Micros emit an annoying buzz from the loudspeaker during hormal use. This is caused by signals from the data bus being amplified. A 10Kohm resistor across pins 16 and 15 of the 1MHz bus should cure it - you can either fit a plug, or solder it to the corresponding tracks on the PCB. Acorn will be doing this themselves soon.

Secondly, if the tinniness inherent in the small internal speaker is restrictive, you can connect an external amplifier of 50Kohms impedance to pin PL16 on the PCB. These modifications might affect your warranty, so check with your local Acorn Service Centre.

Statement syntax

Moving on to documentation, I presume that the Envelope and Sound statements are now understood, thanks to the new user guide and to previous articles such as that in July Your Computer, but briefly, the Envelope statement has the following syntax:

Pitch Amplitude envelope envelope n,1,p1,p2,p3, a1,a2,a3,a4,t1,t2 Envelope n1,n2,n3

where n is the envelope number - usually 1-4, or 1-16 if not using tape filing in Basic: and 1 is the length of a time step - usually 1-127 for pitch envelope repeat. Add 127 if the pitch envelope is not for repeat. The change of pitch per step in the corresponding pitch parts is given by p1,p2,p3 from -128 to 127. The number of steps in each part of the pitch envelope is designated by n1,n2,n3 from 0 to 255. The al,a2 give the change of amplitude in attack, and change of step in decay parts, using values from -127 to 127. The a3,a4 give the change of amplitude in sustain and the change of step in release, using values from -127 to 0. The t1,t2 are the target levels for amplitude at the end of the attack, decay parts; 0 to 126. And here, briefly, is the syntax for the Sound statement:

d = dummy flag, 0 or 1 s=sync flag, 0 or 3 f = flush queue flag, 0 or 1 c = channel number, 0 to 3 a = amplitude, 0 to -15 for envelope 1 to 16 p=pitch, 0 to 255 for a music channel, or 0 to 7 for a noise channel d = duration of sound 10 to 2550ms.

In BBC Basic sound qualities are programmed using the Envelope statement as shown above. However, a statement followed by 14 parameters does not give much idea of the sound it will produce.

The EnvPlot program, for 32K, allows you to draw an envelope directly on the VDU by moving a cursor around. Then you edit it, sampling the sound produced. You define the

Whether your musical tastes are heavy metal or Trapp family singers the BBC Micro has something to offer. This month and next month Chris Melville shows you how to turn your BBC into a musical instrument.

pitch and amplitude parts separately on separate axes.

EnvPlot enables the user to start from scratch and define both pitch and amplitude envelopes on the screen. The program is either in Pitch Mode; blue background, pitch envelope/axes displayed, pitch envelope information displayed at top of screen: or Amplitude Mode, red background, amplitude envelope/axes, and amplitude envelope information at top of screen when the user is entering or manipulating the amplitude envelope.

The two modes are interchangeable at any stage, and if you re-enter either, you will be returned to where you left off. There is a cursor on the screen which is moved about by using the arrowed keys. You cannot move the cursor anywhere that would produce out-ofrange parameters.

Presssing any function key will rub out the cursor and, when the function has been executed, the cursor will reappear on the lastentered point. All of the functions are foolproof. For example, you cannot Sound the envelope unless you have completed both

pitch and amplitude sections. All parameters entered are checked before they are accepted.

In Pitch Mode the Y-axis is labelled relative to f — which is the pitch used in the Sound statement concerned.

When moving the cursor about, remember that the dotted line can have a gradient — given as P/STP at the top — of zero even when it is not horizontal, since integer arithmetic and integer parameters cannot give totally accurate results. If the gradient of any section is zero, then, when the computer Sounds that part, there will be no pitch change.

Relative pitch

The Y-axis is the relative pitch, the X-axis is the number of steps. The actual duration of a step depends on what you have set it as.

The pitch envelope has three sections, for each section the computer needs to find the gradient, that is pitch/step; and its length in steps to use in the Envelope statement.

Whether the pitch envelope keeps cycling over is, of course, determined by the value chosen for the step length. In Amplitude Mode the Y-axis represents amplitude, the X-axis represents steps.

The parameters taken for the amplitude part of an envelope statement are somewhat odd, and the system used by the computer can cause amplitude envelopes to differ from the one you have drawn.

For this reason it is usually best to have a horizontal sustain section otherwise the note will fade quickly due to inaccuracies caused by the computer's Sound software dealing only in integers. (continued on page 57)

THE ULTIMATE **ADVENTURE** FOR THE SPECTRUM/ZX81 for only £9.95

Your eccentric father has left you £10,000 in his will. In order to claim your windfall you must solve twelve clues and gain access to a bank account in which the money has actually been deposited. Be the first to crack the puzzle and the prize is yours! Plus you will win two tickets to the city of the secret KRAKIT™ vault location. The prize money is increased weekly. A telephone number will be supplied so you have the opportunity to find out just how much you could win.

> When ordering please state whether for Spectrum or ZX81

AND THE CHANCE OR MORE KRAKIT TRADE MARK OF INT KRAKIT TRADE MARK OF INT. PUBLISHING & SOFTWARE INC.

> The first qualified entrant to be confirmed by the judges to have completed all the clues correctly is the winner.

There will be one winner only.

No persons connected to Artic Computing Limited or International Publishing & Software Inc. or their families are eligible to enter KRAKIT.TM

This offer is not valid where prohibited by law.

Due to the confidential nature of KRAKITTM we regret we are unable to enter into any individual correspondence. All the required information, including how to claim the prize, is on the computer tape.

The winner will be required to sign an affidavit of compliance with these rules.

DON'T MISS YOUR CHANCE TO WIN A FORTUNE!

396 JAMES RECKITT AVENUE **HULL, N. HUMBERSIDE, HU8 0JA** Dealer enquiries welcome

RULES

(continued from page 55)

The end of the sustain section determines how long the note is Sounded for, although the amplitude can reach 0 before this thus effectively ending the note.

The release section does not have to end on the X-axis, it is only its gradient that is needed for the Envelope statement. Now for a complete description of all the functions assigned to the soft keys:

FO EnterPoint Enters position of cursor as next point on current envelope.

F1 DeletePoint Deletes last point entered. F2 Parameters Gives completed envelope

as the Envelope and Sound parameters needed to produce it.

F3 RescaleAxes Used to rescale the x and/or y axes. There are two options: first, normal rescale-in which the axis is rescaled and any of the envelope parts are adjusted suitably; second, alternative rescale-the axis is rescaled

> but the graph shape is left in the same position.

Used to set the length of a F4 Set Step step, and also whether the pitch envelope auto-repeats or not.

Demonstrates a completed F5 Sound Env envelope in one of three voices

F6 Amp Mode Enters program into Amplitude Mode

F7 Pitch Mode Enters program into Amplitude Mode

F8 Infinite Stn Set any future notes with an infinite sustain part - also cancels it

F9 Unused

Note also that Escape starts the program all over again and so Break should be used to exit the program.

I would like to offer two simple yet useful tips for saving programs (especially long ones) on cassette.

Because of the bugs present in the BBC system, it is a neccessary cassette-filing precaution to Save programs several times in order to ensure at least one will Load back. It can be very boring sitting around waiting for long programs to save so that they can be saved over again, especially at 300 baud, so a good idea is to type:

*KEY 0 SAVE "programname"

MIMTIME = 0:REPEAT:UNTIL TIME = 500 M

Then set your cassette recording and press soft key F0 say four times, one for each copy. You can then go away and have a cup of tea - the program will be saved four times with an inter-program gap of five seconds for those recorders with no motor control.

A much-criticised oversight on the BBC is the lack of a Verify command, since *CAT is not really the same thing. However if you try: *LOAD "" 8000

then the computer will load the target program from hexadecimal 8000 onwards, which is, of course, read-only memory in the BBC Micro. However, although nothing is actually loaded into RAM, the machine still thinks it is loading a proper program. It will thus report any errors that occur, including the corrupting of block 00 - the most common of the cassette-filing system bugs.

ZX81 Spectrum MANAGEMENT GAMES

Airline — £5

Can you compete with British Airways? You must decide on the number of aircraft to operate, whether to buy or charter, whether to enter into a loan or a fuel contract and the levels of staffing and maintenance. Problems encountered are tax demands, strikes, cancelled flights, hijacks and aircraft crashes.

Autochef — £5

As MD of a Cetering Company you must negotiate for leases, decide on menu prices, level of wages, advertising and dividends. Each year you must predict the inflation rate. You are also given options on consignments of wines and food and loan contracts. You will be made to resign if you are not successful. There are 3 levels of difficulty.

Print Shop — £5

You own a small printing company and are required to decide on (a) the number and type of staff you employ and when to increase or reduce staff (b) the amount and type of paper you stock (c) the week in which work is schedules (d) the quotation for each. Are you an entrepreneur? Test your business acumen to the limit! There are 3 levels of difficulty.

Business Model Modeller X £8

This is a very User Friendly business modeller. It does not have the flexibility or the complexity of Micromodeller. However it does provide managers with a useful business tool and an introduction to modelling. The model shows the profit sensitivity and the interaction of the pertinent marketing and production factors of a

Fast Action Games in Machine Code

TREASURE HUNT (Spectrum) Explore one of the 29 mazes in search of treasure and grab as much as you can before the time limit. This game can be played with or without moving obstacles; with one player, two players in opposition, or two players in partnership; and with part or all of the maze visible. There are 144 variations of this fascinating game and even the game selector is fun to use

HUNT (16K ZX81) A ZX81 version of Treasure Hunt with 48 variations.

X-MEN (16K ZX81) The only Puckman type game with all these features: true gobbling action, bonuses, arcade type maze, 3 lives, graphic display of lives left, 4 monsters, a den, booster buns, high score, continuous on-screen scoring.

UFO (16K ZX81) A fast moving space game in which you must defend the Earth by destroying all the UFOs and spy satellites while your moving force field gradually gets worn away by the alien bombs.

TRAP (16K ZX81) You control a moving wall and try to surround your opponent (computer or human) before he surrounds you. There are 3 speeds and games can be played with a border or wrap around screen.

INSTANT IMAGE TRANSFER TO ZX SPECTRUM RD DIGITAL TRACER £49.95

£49.95 each. I enclose payment of £	
Name:	
Address:	
Send to: RD Laboratories, Dept. YC	N, 5 Kennedy Road, Dane End

RD Laboratories' policy is to bring sophisticated computer techniques to low-cost computing. RD Laboratories therefore maintain the right to amend specifications at short notice. Please send stamp for further details of the RD DIGITAL TRACER, and the RD 8100 SYSTEM for automatic monitoring, test and control.

The high resolution colour graphics of The ZX Spectrum permit accurate presentation of complex or irregular images – maps, technical drawings, even personalities. But entering individual coordinates for unusual shapes can be tedious and time-consuming.

The new RD DIGITAL TRACER cuts out much tedious plotting. It provides instant transfer from original to display file - for screen display in colour, ZX printer printout, or retention on cassette.

The RD DIGITAL TRACER is of immense benefit in many fields – for geographers and weathermen, for engineers, architects and technicians, even for budding Leonardos! Designed for use with the ZX Spectrum, the RD DIGITAL TRACER as supplied is compatible with ZX 81, although high-resolution colour graphics cannot be obtained on this machine.

The RD DIGITAL TRACER is available only from RD Laboratories. The price of £49.95 includes P & P and VAT. Send your cheque now for delivery in 28 days. (Cheques payable to "RD Laboratories".) The RD DIGITAL TRACER is supplied with tracing sheet, software cassette, and full instructions on use.

Laboratories

5 Kennedy Road, Dane End, Ware, Herts. SG12 OLU (0920) 84380

If snowdrops and Spectrums are among your favourite things, these valuable machine-code routines by Jeremy Hall will help improve your micro's soundproducing ability. Impressive noises can be produced to rival the machine-code routines used by software houses.

WITH A LITTLE knowledge of machine code and of how the Spectrum produces sound, some quite impressive noises can be produced, despite its limited sound facility.

The Spectrum produces sound by sending a series of clicks to its internal loudspeaker. The time interval between each click, and hence the pitch of the note, is dependent on the value held in the HL register pair of the Z-80. The higher the value stored in HL, the longer the interval between clicks, hence the lower the pitch of the note produced, and vice versa. The length of the note produced, that is, the number of clicks, is controlled by the value stored in the DE register pair; the larger the number, the longer the note.

Having set these registers to the required values, it is then simply a matter of calling the sound-producing routine in the Basic ROM. This starts at address 03 B5 hex, 949 decimal. Program 1 demonstrates this idea very simply, and figure 1 shows the machine-code mnemonics of this program. Try changing some of the values of HL and DE in this program by altering the Data statements, but before you do this, save the program on cassette in case you crash the system.

It probably will not take you very long to tire of program 1 and you will want to move on to some more interesting sounds. This is where program 2 comes into it; figure 2 shows the machine-code mnemonics for this program. Register B is loaded with the number of times that the whole sound is to be repeated. Try loading it with 1, that is change the second number in the data statement from 10 to 1.

HL and DE are set to the required value and the sound routine called. On returning from the routine, DE is loaded with 16, which is then added to HL to increase its value, and lower the pitch of the next note. The sound routine is then called again, and this process repeated 255 times. Register B is then decremented and if it is zero the program will end and return to Basic, otherwise the whole process will be repeated. Note that registers HL and BC must be saved by it.

In the final program, program 3, the machine code held in each data statement is based on the previous program, but with different values of HL and DE in each case. Enter the program exactly as shown, with the correct number of zeros after each Data statement. These zeros are used as padding to make each routine 30 bytes long and thus make each USR address easier to remember -32400 to 32430 and so on. Try experimenting with the values of HL and DE again; you might be surprised at the results.

BEFORE ENTERING the main Basic program the machine-code routine should be entered using the following Basic program.

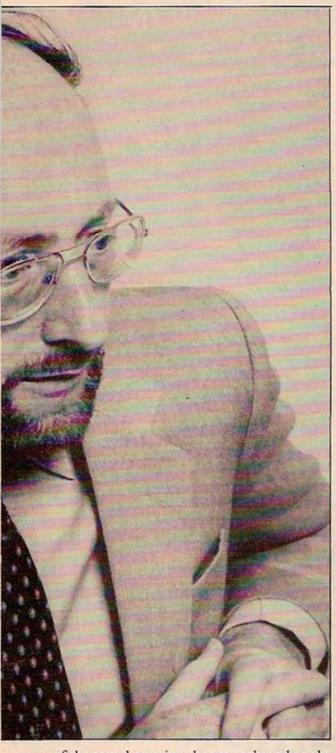

10 FOR n = USR "r" TO USR "u" 20 INPUT a

30 POKE n,a 40 NEXT n

After entering the program, type Run and press Enter, then enter the numbers in the lefthand column taking / as Enter. The mnemonics are included for machine-code enthusiasts.

33/56/92/ LD HL, (5C38) LD A,00 62/0/ LD (HL), A 119/ 6/255/ LD B,FF 219/250/ IN A,(FA) 254/255/ CP FF 40/1/ JR Z 01 52/ INC (HL) 16/247/ DJNZ-9 RET 201/ 0/0/0/0/0/0/0/ NOP (*7)

The machine code acts as a crude frequency counter by looping round 255 times and adding 1 to the location 23608 each time it hears a noise through the ear socket. We are therefore left with a number between 0 and 255 at location 23608 each time we call the routine. This number will correspond to the frequency and, to some extent, the amplitude

of the sound entering the ear socket when the routine was running.

To use the program you will need some kind of input to the ear socket; you could use a radio or a cassette recorder. To use the main Basic program you will need some way of connecting a microphone to the ear-socket, via an amplifier so that the computer can analyse your voice dynamically - as you speak.

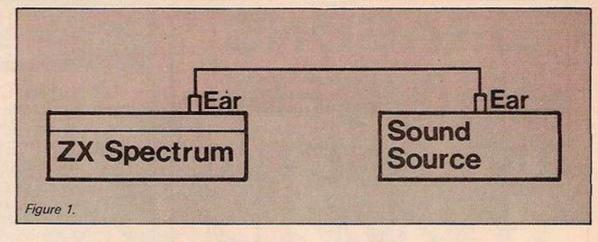

Sound source

To use the program, plug the ear lead on the Spectrum into the ear lead of your sound source as shown in the diagram, figure 1.

If you want to see the program working but cannot connect a microphone to your Spectrum, then Enter the following short Basic program.

> 10 FOR n = 1 TO 175 20 LET a = USR USR "r" 30 PLOT 0,n 40 DRAW PEEK 23608,0 50 NEXT n 60 CLS 70 GOTO 10

Type Run and Enter and gradually turn the volumn of your sound source up until you see a fine bar graph across about one quarter of the screen; your computer is now displaying

TALKTO If the strain of pushing keys is telling, J D M Edwards' program lets you sit back and relax. SPECTRUN

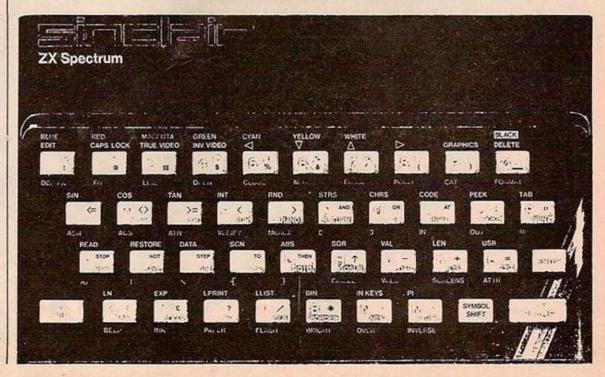

the sound that is going into the ear socket. If you can connect a microphone to your computer then try this Basic speech-analysis program. After entering it, type Run and switch on your microphone. Enter how many words you want - I suggest two for your first try - then enter which word you want to enter first. You shold see the words "Speak after tone" appear, accompanied by a beep.

The machine will then wait for a sound in the mike before it starts inputting information, so you can take your time before saving your word after the tone has stopped. When you have said your word, sit back and wait until the machine asks for the name of the word. After entering this you will be given two graphs at the moment identical and will be

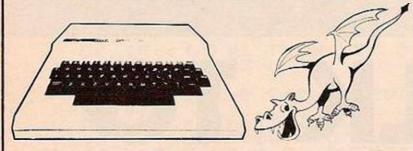

asked if you want to learn or continue. Select learn and you will again be faced with the prompt "Which sound?". This time enter 2 and repeat the process. For better results repeat each word several times - not on the same analysis, but respond with each number several times to the prompt. This will be averaged out to provide a more accurate result.

Word matching

Having repeated each word several times, respond with Continue to the prompt and say one of your words after the tone. The Spectrum will sort through its files and print the word nearest to yours. Although slow, this method has a good success rate and could be rewritten in machine code to save time.

LIVERPOOL L3 3AB.

ALL THE PROGRAMS in this series of articles will run on a 1K ZX-81. In fact if you have a RAM pack you will need to remove it, or reset RAMtop to less than 3.25K.

The first essential when producing a games program is to set up the background display. With the 1K ZX-81 the display file is collapsed, so it is impossible to Poke the characters into the display. Therefore one must first set up a display file of the size required.

In machine language there is an instruction RST 10 — D7 hex. This is a very important instruction on the ZX-81: it is only one byte long and instructs the computer to print a character, held in the A register, in the first free space on the screen. If you look at program I you will see how this is done.

168	514	3E 1C D7 C9	LD A, 1C RST 10 RET	CHR\$ 0 Print it RET TO BASIC
		M YO NO		
Pre	ogra	m 1.		

With the demonstration programs 1 to 5 there is no need for a hex loader, since they all can be keyed in. Keywords are emboldened; Some keywords such as Copy are entered by typing Then Copy and erasing the word Then.

The 0 in program 1 can be replaced by any character available from the keyboard. The character will be printed in the first available print position, that is 0,0.

Program 2 demonstrates how to print up to 255 characters consecutively on the screen using the instruction DJNZ-10 hex. This instruction carries out two operations; it reduces the number held in the B register and jumps a specified distance if the number is not zero. In this case it will jump backwards -3 places FD hex. FF is -1, FE is -2, FD is -3 and so forth. The maximum number of places forward is 127 and backwards is 128.

16514	3E 1C	LD A, 1C	CHR\$ 0
	06 FF	LD B, FF	Load B with 255
	D7	RST 10	Print a CHR
	10 FD	DJNZ-3	Reduce B by 1
			and if not zero
			then go back to
35/1/2			print a CHR
	C9	RET	RETURN TO
			BASIC

1 REM Y0 ■ COPY NOT CLEAR TAN 2 RAND USR 16514 Program 2.

If more than 255 characters are required then either repeat program 2, or use program 3 which enables a full screen to be set up. With this program the HL register pair is used because it can hold numbers greater than 255 — a full screen requires 726 characters. It works in a similar way to program 2, except that the check for HL zero is made using the A register. The A register is loaded with the value held in the H register and then an Or L operation is carried out on the A register.

This simply means that if H is not zero, or if L is not zero, then the result is not zero. But if H is zero and L is zero, then the result is zero.

This result can be used to jump forwards or backwards.

In this case, the jump is backwards to reload A with the character to be printed and continues until HL is zero.

The quotation marks after the 5 are a shift Q and the P before the 4 is an inverse P. The direct command is necessary because 7C is not available from the keyboard. However, not many games programs use just one character as a background. A method of printing more information on the screen is shown in program 4, where the word "Hello" is printed. This works in a similar way to the Basic

10 LET A\$ = "HELLO" 20 PRINT A\$

The first step is to set up Hello as Data to be read, then printed, one letter at a time. The word Hello in program 4 is held at the start of the Rem statement. In other words, address 16514 holds the letter H, 16515 holds E, 16516 holds L, 16517 holds L and 16518 holds O. HL is then loaded with 16514 — that is, it points to the first letter to be printed. The B register is loaded with 5 — the number of letters — and the A register is loaded with the contents of the address held in the HL register pair.

So the first run-through prints the letter H. The HL register pair is then increased by one to point to the letter E and the B register is reduced by one. A check is made to see if B is zero and, if it is not, a jump back to load A with contents of address held in HL is made. This process continues until all the letters are printed, that is, until B=0.

The final demonstration program shows the memory economy available with machine language. It will print out an eight-by-eight squares checkered board and does the same as the Basic program:

This program uses two counters: the B register to count eight characters per line and the C register to count eight lines. To save memory, the C register is also used to select the start of Data to be printed. Each board line either starts with a black square or a grey square and so only nine squares need be stored as Data.

The start address of each line is then 16514 and 16515 alternately. The start is selected by looking at Bit 0 of the number held in the C register, if it is 0 then the start is 16514 and, if it is 1, then the start is 16515. Bit 0 is the first number of the binary notation of the hexadecimal number and runs as follows:

8 = 1000 7 = 0111

16514	21 CO 02	LD HL 704 dec
	3E 1C	LD A, 1C
	D7	RST 10
	2B	DEC HL
	7C	LD A, H
	B5	OR L
	20 F8	JRNZ
	C9	RET

REM 5 "" Y0 NOT F ? P 4 SAVE TAN POKE 16521,124 Direct command

2 RAND USR 16514 Program 3. 6=0110 5=0101 4=0100 3=0011 2=0010 1=0001 0=0000

So you can see that with each run through of the program bit 0 changes from 0 to 1 to 0 etc., so that the start of Data changes from 16514 to 16515 to 16514, and so on.

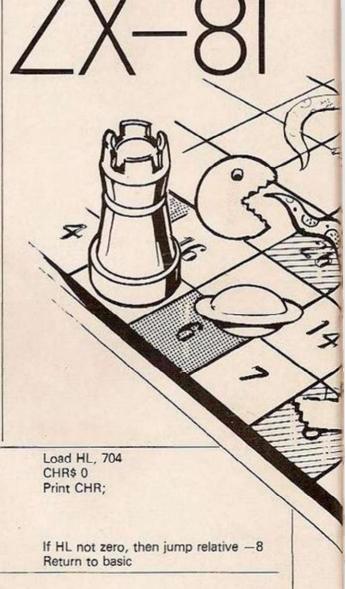

The listing for the programs will look a little strange after the direct commands because of the hex 76 Newline character and the 7E character, but do not worry — the machine code is still there, as is line 2. Just the computer to list line 2. The grey squares are all graphics shift A.

Now to tackle the display for the Frogger

16514	2D 2A 31 31 34	"HELLO" DATA

program. The technique used is exactly the same as program 4, in that the display is held in Data form and is printed from Data to the screen. Because of the length of this program it is necessary to use a hex loader Basic program to Poke the machine code into the Rem statement. So to start, type the Basic:

POKE 16530,126 Direct commands

POKE 16536,118 Direct commands

RAND USR 16523

1 REM 255 0s

Program 5.

EN INPUT A\$ HEN STOP CODE A\$ + CODE A\$(2) -476 ,); X; ""; A\$ (1 TO 2) 70 LET X = X + 1 80 LET A\$ = A\$ (3 TO) 90 GOTO 30 RUN

To save typing out Rem statements, type line I then Edit it. This will take a second or two to bring the line into the Edit position. Then change it to line 2. The first Rem statement is used to hold the machine code to print the display; the second Rem statement is used to hold the machine code to make it move.

At each input prompt enter the hex numbers as listed. These may be entered in batches of up to 10 pairs, but remember there are no

spaces between the codes. After inputting code 32 hex at address 16768 enter S to stop the Basic program and change to Slow mode.

Edit line 10 to read

LET X = 16775

and Save the program for use with next month's article.

To check that your machine code is correct, change line 10 to

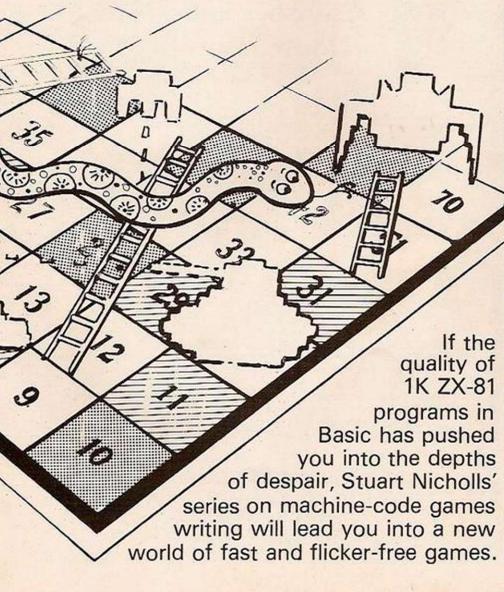

RAND USR 16702 . POKE 16819, 201 direct command and delete lines 20 to 90.

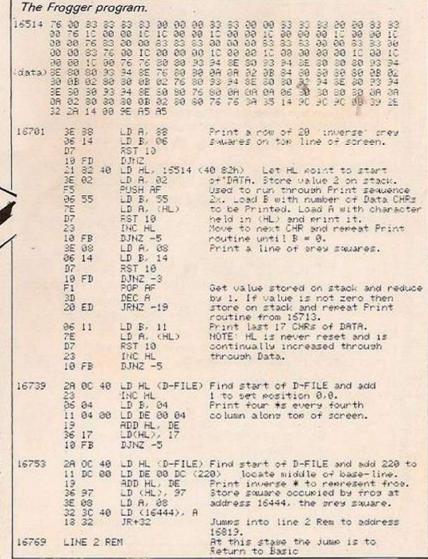

Now enter Run, and you should have a stationary display for the game.

The object of the game is to hop your frog, an inverse *, across the road, avoiding all the obstacles, to the safe middle island, then hop on to the lily pads represented by 0s and logs represented by s and finally into one of the four homes. Each home is represented by a *.

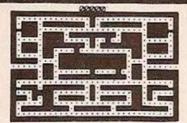

The frog is controlled by pressing key 5 to go left, 8 to go right and 0 to go up. Each move up is counted, and a time limit of 199 seconds is given in which to fill all four home bases. If a frog is hit on the road, jumps into the lake, hits the wall or floats off the screen on a lily pad or log, then it is dead, and another frog is given at the base line. You cannot hop the frog off the screen.

The game finishes when all four home bases are filled or when the counter reads zero. The aim, therefore, is to fill all home bases in the quickest time, with the least number of up hops.

SPORTING FORECASTS

Professor Frank George, one of the country's leading experts in forecasting techniques, has produced the following microcomputer programs based on his researches.

F4 FOOTBALL FORECAST

A pools forecasting program which uses stored team data to compute the expected result of each fixture.

Produces full perms according to amount of stake and number of matches required.

H5 HORSE RACE FORECAST

A serious punter's aid to sensible betting. Data is entered from a sporting newspaper and the program produces betting recommendations.

A detailed instruction booklet accompanies each program. Versions are available for:

APPLE II 32K **PET 16K or 32K** SHARP MZ80K TRS-80K 32K disk or 16K cassette VIDEO GENIE 32K disk or 16K cassette NEWBRAIN SINCLAIR ZX81 16K

versions under development: BBC; SPECTRUM

WEEKEND COURSES SINCLAIR BASIC

Why struggle with the book when you can learn basic and relax in the comfort of a 3 star Hotel.

Come and learn Sinclair Basic at a week-end "teach in". Friday evening to Sunday evening with 15 hours of instruction from well qualified instructors. We use the ZX81 with 20 people maximum on each course and 2 people to each computer.

The Hoel is comfortable, all bedrooms have bath, colour TV, tea making facilities and hair driers, etc. The price includes a sherry on arrival and all meals.

Our conference rooms are all well equipped with white boards, film screen and other audio visual equipment.

Courses start January, 1983 priced at £55. For further details write or contact Penny King on 0562 754041.

GAINSBOROUGH HOUSE HOTEL BEWDLEY HILL, KIDDERMINSTER, WORCS. DY11 6BS Tel: (0562) 754041

The Vic's operating system interrupts a program 60 times a second to scan the break key and update the time variable. Ian Hegerty shows you how to use the interrupt vector to insert your own routines for fast graphics or to check an input from an alarm bell.

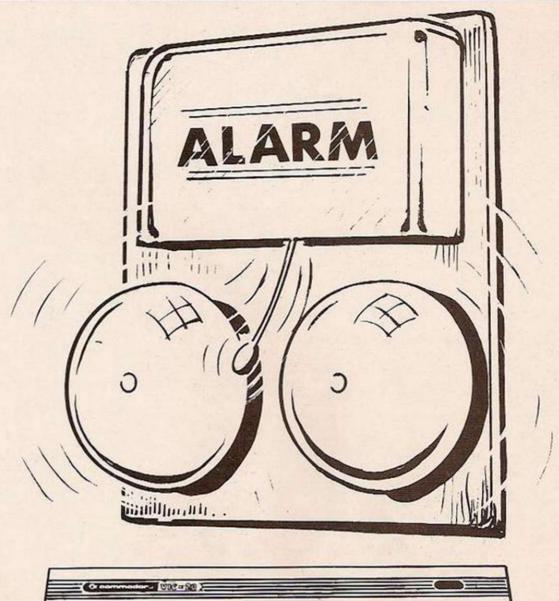

THE INTERRUPT vector on the Vic is located at 788 and 789 - £0314 and £0315 in hex. Every 0.016 seconds, the 6502 processor looks at this location and jumps to a routine, the address of which is stored thus: the address divided by 256 is stored in the second location, 789, and the remainder is stored in the first, 788.

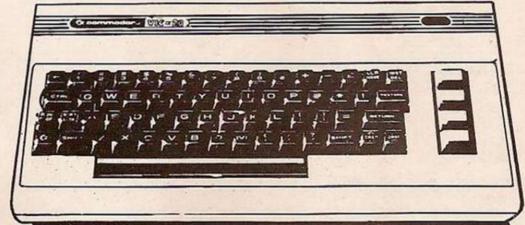

The interrupt vector may be used in the following ways. But first, stop the processor from reading the interrupt vector while you set it. If this is not done, you will get strange results - it might go to a part of the address to which you have pointed, while taking the other byte from the original value. This can be done in machine code with an SEI command: the op-code is £58.

Next, set the vector using the LDA and STA instructions. Then, restart the processor interrupting with a CLI instruction, and return with an RTS instruction. At the end of your machine-code routine, you must jump back to the original value of the vector - this increments TI and TI\$ and scans the stop key and is at £EABF.

Here is an example showing the use of the interrupt vector.

- 10 REM *INTERRUPT DEMO*
- 20 REM *BY I HEGERTY*
- 30 FOR A = 7424 TO 7450: READ B: IF B< >-1 THEN POKE A, B: NEXT
- 40 REM *MACHINE CODE*
- 50 DATA 120,169,13,141,20,3,169,29,141,21,3, (continued on next page)

HARNESSING THE VIC'S VECTOR

10 REM *KEY DEFINE* 29 REM *BY I. HEGERTY* POKE 55,56: POKE 56,29:8 = 748030 READ A: IF A: = "*" THEN PRINT "DO TO START, SYS 7480" :END 40 50 H = ASC(A s) - 48 $L = ASC(RIGHT \pm (A \pm 1)) - 48$ 50 IF H > 9 THEN H = H - 770 IF L) 9 THEN L = L - 7

(listing continued on next page)

(continued from previous page)

60 DATA 169,8,141,15,144,169,27,141,15,144, 76,191,234

Run it and see what happens, after you have Saved it. If it crashes, turn off the Vic, reload the program and check lines 50 and 60. When the program is successfully Run, Ready should be printed and black lines will be visible. The screen is turning black to white so fast your eye cannot see it. Here is a breakdown of the machine code in lines 50 and 60:

Hex	Mnemonic	Dec	imal		
78	SEI	120			
A9 0D	LDA £0D	169		13	
8D 14 03	STA £0314	141	20	3	
A9 1D	LDA £1D	169	29		
8D 15 03	STA £0315	141	21	3	
58	CLI	88	7		
60	RTS	96			
France 1	and the state of t		The same of the same of	William Co. Co.	

This listing sets the vector, and the following listing changes screen colour.

A9 08	LDA £08	169	8	
8D 0F 90	STA £900F	141	15	144
A9 1B	LDA £1B	169	27	
8D 0F 90	STA £900F	141	15	144
4C BF EA	JMP £EABF	76	191	234

There are many applications for the interrupt vector, including graphic effects, sound effects running continuously, giving keys certain functions, and checking inputs like those from a burglar alarm. You could even control the cursor with a joystick. Keys can be programmed by looking at the value in £C5, that is, 197 decimal, and CMParing it to the values of the keys - key f1 equals 39, key f3 equals 47, key f5 equals 55, key f7 equals 63. It is important to note that these are not the ASCII values. If you want the keys plus their Shift values, you can Peek 653 - £028D in hex. If the value in this location is one, the shift key is down, if it is two, the Commodore key is down, and if the CTRL key it will be four. Combinations of these are possible - if the Shift and CTRL are both down, the value will be

1 + 4 = 5

To demonstrate all this, run the program Key Define and then

SYS 7400

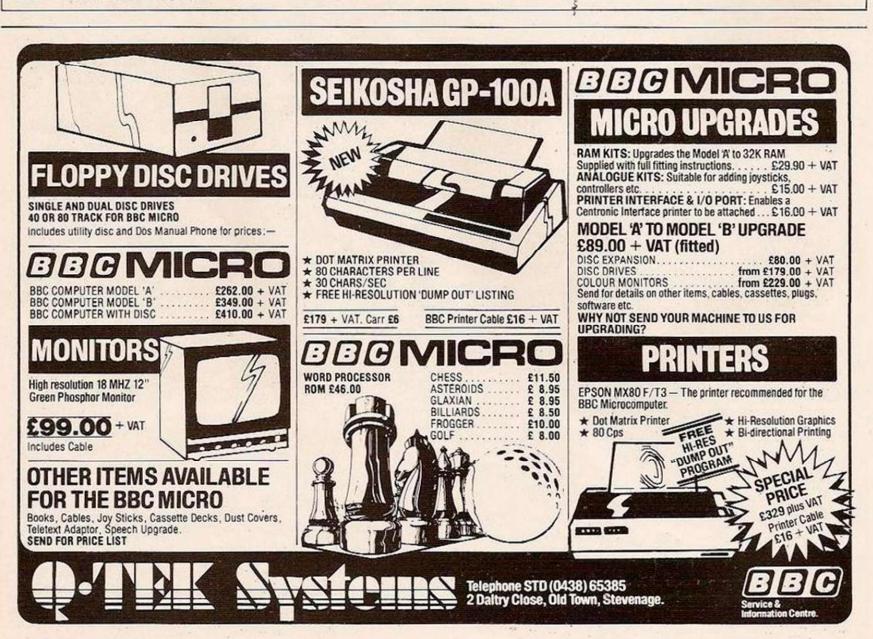

Key Define uses the interrupt vector to program the function keys. Yes, those brown things on your Vic can now actually do something useful. The functions are as follows: key fl turns the screen black; key f2 returns screen to normal; key f3 turns sound volume to full; key f4 turns off sound; key f5 turns motor power off on the cassette unit; key f6 turns motor power on on the cassette unit; key f7 makes all the keys repeat; key f8 returns to normal key repeating.

Pressing CTRL, Shift, Commodore and function key f3 results in a total reset — the same as turning off, but with the advantage that this routine may be recalled with another

SYS 7400

How to make the best home computer in the world even better.

Peripherals to turn a powerful computer into a super-computer for the professional.

With VIC, you have the finest home computer money can buy. And the more you use it, the more you will ask it to do.

Pretty soon, you'll want to extend VIC's vast potential to the full; and there is a wide range of VIC peripherals to help you do it.

Disk drives, disk-based software, a printer, cassette unit, joysticks, paddles-with these, VIC computing becomes total computing: giving you true professional power and capability.

We describe the major units here.

VIC PRINTER

like all VIC peripherals, offers a very high specification at a very competitive price.

It will print programs, letters, business data, graphic displays and so on.

Its main features include: 80 characters per line • Tractor feed dot matrix • 30 characters per second print speed · Full alphanumerics and graphic printing · Double-size character capability · All cables and leads.

VIC FLOPPY DISK UNIT

The VIC single-drive Disk Unit provides a fast, accurate and efficient means of storing and retrieving data and programs.

Together with the Printer, it transforms the VIC 20 into the ideal system for the small businessman or serious computer programmer.

Features include: 174,848 bytes capacity • Uses soft-sectored standard 51/4" single density floppy disks · Direct

interface to VIC · Direct compatibility with Printer Intelligent system independent of VIC.

VIC RAM not required to run it).

EXPANSION MEMORY CARTRIDGES

Special plug-in cartridges are available to expand VIC's memory. 3K, 8K and 16K RAM packs plug directly into the computer.

A Memory Expansion Board is also available to develop VIC's capabilities to the maximum.

For full details of VIC 20, its peripherals and software, and a list of your local dealers, contact: The Commodore Information Centre, 675 Ajax Avenue, Slough, Berkshire, SL14BG. Tel: Slough (0753) 79292.

Ecommodore The best home computer in the world.

Let Commodore expand your horizons.

VIC 20 is the finest home computer that money can buy.

And the better you get to know it, the more confident, adventurous

and ambitious you'll become.

You'll want to take advantage of the vast range of VIC software: a superb and constantly-growing selection of programs, embracing business systems, entertainment, education and many applications in the home.

Every program in the series has been designed by experts, and chosen for its quality and value

for money.

VIC business software covers a wide range of applications, including spread-sheet analysis, stock control, information handling and word-processing.

A mind-blowing range of games including Scott Adams' world-famous 'Adventure' series.

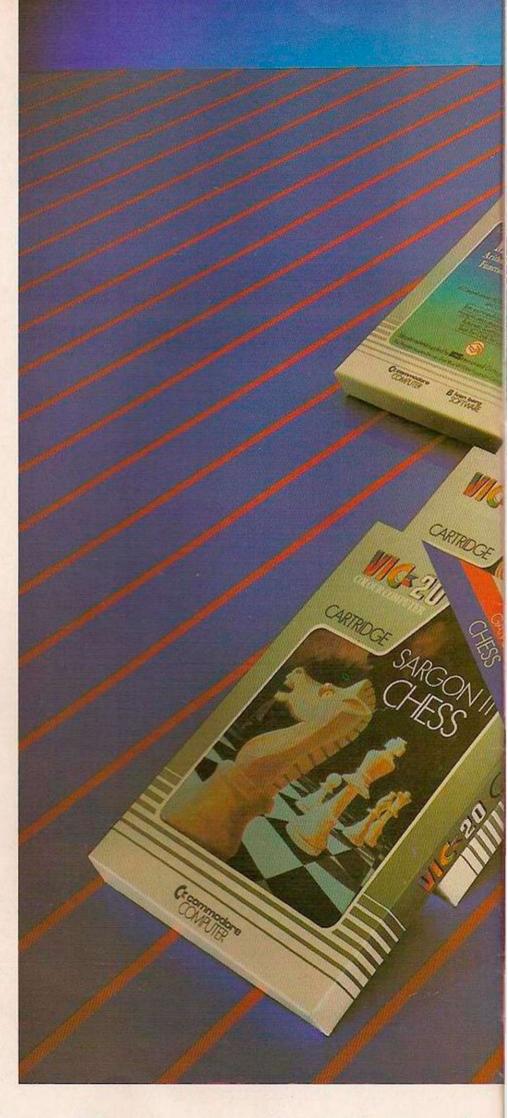

Advanced space games, including the sophisticated 'Omega Race'.

Learn subjects as diverse as English Language, programming, and biology.

And 'home' software ranges from IQ tests to Robert Carrier

menus.

In addition, there is a range of VIC software, like programmers' aids and graphics packages-

to add to your understanding and enjoyment of computers and

computing.

There's even a special 'VicSoft' Club for VIC 20 enthusiasts, with many advantages including special offers to club members.

PRICES RANGE FROM £4.99 to £24.95 INC. VAT.

complete the coupon and send to: The Commodore Information Centre, 675 Ajax Avenue, Slough, Berkshire SL1 4BG. Telephone: Slough (0753) 79292.

VCYOC 11/82

Martin Glass's Teletext Editor is a program with features common to commercial wordprocessing packages. It will run on both the Models A and B.

THE PROGRAM options are listed in the form of a menu giving five choices of action. The menu's third option gives a blank screen on which can be drawn a teletext picture with colour, graphics and double-height characters. In this mode, the four cursor keys can still be used to position the cursor anywhere.

The special teletext control codes are made available through the soft-function Copy and Tab keys. Thereby all the special teletext functions can be used to build up pictures similar to Ceefax, Oracle and Prestel. Once the picture is complete, it can be saved on tape, using the first option in the menu. Previouslystored pictures can be re-loaded using the second option. The fourth option allows you to continue editing from where you left off.

The fifth option on the menu is the Help option. This details each of the special functions available and which keys to use. See figure 1.

Key	Function
f0	Conceal Display
f1	Red
f2	Green
f3	Yellow
f4	Blue
f5	Magenta
f6	Cyan
f7	White
f8	Flashing characters
f9 + colour	Graphics
f9 + f8	Hold graphics

New background colour
Pixel-separated graphics
Double-height characters
Move around
Return to menu
Negate prior function
Shift text left
Shift text right
Insert a line
Delete a line

Figure 1. The fifth option - Help.

Different colours are chosen on keys f1 to f7, but alternative graphic characters can be selected by pressing f9 before the colour key. Pressing f0 conceals the display line by changing the foreground colour to the back-

Characters can be made to flash with key f8. To return to steady mode, press f8 then the Return key. It is important to note that the Delete key has been given the new value of 255 and not 127, so its use will produce a block character. It will not erase the previous character, but it does complete the full set of 64 graphics characters.

The Hold graphics mode - which covers over subsequent teletext control codes with the most recent graphics character - can be selected by pressing f8 immediately after f9.

Similarly, f9 followed by Tab will define the separated graphics mode, which causes each pixel in the three-by-two graphics matrix to be detailed individually.

The Tab key on its own will change the background colour to the most recentlydefined colour. Therefore, a new foreground colour must be set immediately after Tab, otherwise the text will be concealed.

Double-height characters have been simplified by the program and can be accessed after using the Copy key. The program takes care of all the duplication of text usually associated with the double-height effect on the BBC Micro. To return to normal height press Copy followed by Return.

In general, the Return key will move the cursor to the start of the next line, but when used immediately after one of the special teletext functions, then the effect will be to negate that function. For example, Tab followed by Return restores the background to black.

Four functions

Four Edit mode functions move text around the screen by inserting or deleting characters. The first extra function is Control/L, that is, the Control key is held down whilst the letter L is pressed. This function deletes the character pointed at by the cursor and shifts a line of text to the left. Similarly, Control/R inserts a space and shifts the line to the right. In a likewise manner, Control/D moves text down by inserting a blank line, whilst Control/U deletes the current line and thus moves text up.

When the Editing is finished, pressing

Escape will return control to the main menu. Back in the menu, the page can be saved on tape by choosing option 1. The screen can then be wiped clean using option 3, or the previous page can be recalled for further editing with the fourth option.

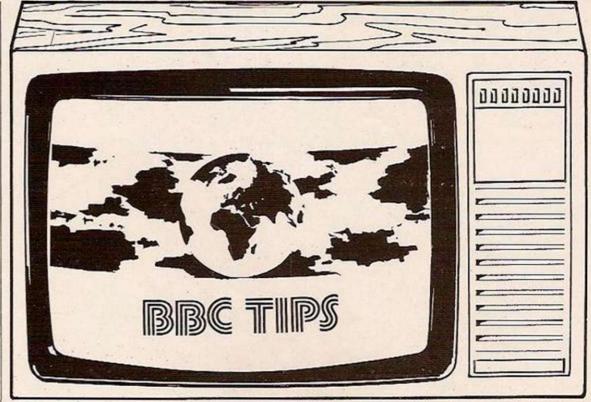

Option 2 in the menu will load a previouslystored page from tape back into memory for further editing; follow this option with option 4 to recall the edit screen. Pictures will be stored on tape, in option 1, in Filename Screen, which is constant in the program and not user-defined because the BBC OS command *Save cannot be suffixed with a Basic string-variable.

Option 3 will clear the editing-screen memory area, so be careful to save any useful pages on tape before using this option.

In Mode 7 on the BBC Micro, the screen display is stored in locations &7C00 to &7FE8 and HiMem is originally set to &7C00. The first action of the program, in line 30, is to set aside a 1K byte spare area between &7800 and &7C00 which can be later used to store a copy of the editing screen.

The machine-code routines, GetScreen and PutScreen, in lines 70 to 480 perform the function of copying the screen display stored between &7C00 and &7FFF - to or from the secondary store, which is stored between &7800 and &7BFF.

The next section of program, lines 510 to 560, assigns the soft-function keys with single-

code values, which are used for changing colour and other effects. Note that these codes do not match the values given in the table of teletext control codes, but are altered later in the program.

The *FX 4,1 command, in line 590, disables the action of the cursor control and Copy keys, so they can be controlled by the program. The Double% variable keeps tracks of the most recent line of double-height text.

Lines 620 to 790 are the core of the Editor, which Gets a key code and acts on it. Procedures ProcRet and ProcKey are used by the Editor. The Escape key is trapped in lines 1060 to 1100, where the display screen is copied to &7800 and the cursor keys are restored to their original functions with the command *FX 4,0.

The menu-display routine is given in lines 1110 to 1240 which uses ProcDouble to write a string in double height to a specified place on the screen, in any colour.

Lines 1390 to 1690 display the Help page, Option five, while routines ProcSaveScreen and ProcLoadScreen, in lines 1700 to 1770 are used to record or recall pictures on tape, in Filename Screen. Procedures ProcInsert, Proc-Delete, ProcInsertLine and ProcDeleteLine in lines 1830 to 2230 control the extra Editing functions of Control with R, L, D and U.

YOUR COMPUTER, NOVEMBER 1982

These two articles, the first by Michael Fox and the second by Dale McLoughlin, set out handy machinecode routines, with a variety of uses.

MANY USERS WHO have no knowledge of machine code may, nevertheless, want to use it in their Basic programs to enhance speed and presentation. But most machine-code routines lead only to the development of one game or objective. The utility machine-code routines in this article are for the ZX-81, but they can also be used on a ZX-80 with 8K ROM. The effect on the last routine will be lost on the ZX-80 because of the lack of a Slow mode.

The routines contain no absolute addresses, except subroutine calls, so that you can stack them on top of another routine that does use absolute addresses, or on top of each other and they can be called individually.

The routines need a 16K RAM because they all manipulate the display file. There are four routines and I have also supplied a comprehensive loader program. The four routines are;

A screen fill

A downward scroll

ZX-81

TOO

■ A text-window system

A super-cursor

Line 1 of the machine-code loader program should contain the number of Qs needed for the machine code plus a few extra — just in case. It is best to use line 1, although any number will do as long as it is the first line. Line 1 is best because there is no risk of putting a line before it — the ZX-81 has no line 0. The length of the line can be checked by

PRINT (PEEK 16511)-2 or PRINT (PEEK 16511+256* PEEK 16512)-2 if the length of the line contains more than 254 Os.

To enter the machine code, run the program and enter the start location of the machine code, which is usually 16514. Now start entering the values in the third column. If you make a mistake or enter a wrong value — it has a safeguard against entering an empty string — then enter R for repeat and the program will

reinput a value for the last byte address.

If you find a discrepancy in the addresses or some such fault, type L to list the code. The program will input a new start location and list from that point onwards. If at any time you want to pause while you are checking the copy, just hold down any key — other than R — or Space and Break, and the listing will stop until the key is released.

If you press R, the program will return to loading mode and input a new start location. Whenever the location you broke out from is to be retained, enter A and it will carry on from where it left off.

It may be a good idea to type in a large line 1 and then Save the program on tape, rather than typing it in every time it is needed. To stack two or three machine-code routines in one Rem statement, the best way is to type them in one after the other and note the starting address of each routine. This is the address you should Rand USR to call the sub-

KIIS

routine - all subroutines, when on their own, should be called by

RAND USR 16516

Also note that only in the first routine should the two 118s Newline appear. These disable the listing of the Rem statement but should only appear at the start. You will find that on listing only 1 Rem appears, the rest of the Basic program can be listed by List 2, or the number of any other Basic line. To avoid this problem Poke 16419 with the number of the lowest line below 255; then list that line.

Listing 1 is the screen-fill routine which fills the screen with any CHR\$ except tokens and 118 which will crash the system. It works by filling the line, looking ahead one square for a Newline and when it finds one it jumps over that square.

It counts the number of Newlines and after a specified number it returns to Basic. This number - the number of lines filled can be Poked into location 16517 - is set at 22. Do not Poke it with more than 24 or with 0 for there are only 24 lines on the screen and 0 will be decremented to 255 which is above 24 and so will cause a crash. The character printed is at location 16528; it is set as a black square in the listing.

The second listing, listing 2, is a downward scroll. It works by starting at the bottom of the display file and going up loading the accumulator with what is on the screen, copies HL into DE, adds 33 to DE. This is equivalent to moving it down a line. Then it puts the contents of the accumulator in that location and goes on to the next square.

It also looks ahead for a Newline, counts the number of the Newlines found - the number of lines scrolled - and after 22 it returns to Basic. The number of lines scrolled can be altered by Poking location 16520 with the number of lines -1. If it is less than 21, the lines scrolled will be at the bottom of the screen. When you move the bottom of the screen location and reduce the number of lines scrolled, it will only scroll the top lines of the screen.

The top line of the display should be only background as this is what is copied. It must not be used after computer scrolling but can be used before. Values higher than 21 and value 0 should not be used for the number of lines.

To set the bottom of the display file the program must contain these four lines:

LET P = 1 + PEEK 16396 + 256*PEEK 16397 LET P = P + (22*33)-2 POKE 16517, P-256*INT(P/256) POKE 16518, INT (P/256)

The number 22 in the second of these lines is the number of lines to move down. If you move the bottom of the display file as mentioned, this number should be altered accordingly. It does not upset the display file as the computer's upward scroll does.

After seeing Timothy Gilbert's article on how to protect lines at the bottom of the screen by creating a text window at the top in the February issue of Your Computer, I decided to write a routine to produce a text window at the bottom of the display, thereby protecting the top of the screen.

The program works by finding the start of the display file and then moving down to the top of the text window. It then moves each square on the screen up a line, looking ahead for Newlines and counting them. When it has scrolled the correct number of lines, it sets the next print position to the bottom scrolled line and sets the column number to 21. This number in the window is at location 16517 and is set at 5. Location 16519 should be Poked with 23 minus the number of lines.

The bottom line of the window is left clear after a scroll because it scrolls the top line of the bottom part of the screen which is always blank. Input does not affect the routine and vice versa. When using it in a program, rather than using scroll, use

RAND USR 16516

but do not type this in every time it is needed - it is quicker to type in the program and make a list on paper of all the scroll lines. Then, after and typing in the rest of the program, insert a

RAND USR 16516

then edit it and change the line number to

produce the other Rand USRs needed as this is quicker and easier on the fingers.

The routine can also be used to generate windows at any height anywhere on the screen. To do this, Poke 16517 with the number of lines and 16519 with the number of lines down to the top line of the window. Then use the routine as normal but you will have to leave a blank line below the window and, because it looks better, a blank line above as well. This enables two protected, separate and unmoving pictures or text to be displayed above and below a window.

The fourth and final listing is a Super Cursor. It runs a vertical line from left to right across the screen leaving a clear screen behind it. This is very impressive and the only routine which contains absolute addresses. They are in the form of subroutine calls, so if you stack the routines on top of each other; this one would have to be placed at location 16514.

The routine sets itself for the first line and calls a subroutine to draw the line. It then draws another line which clears the first and moves on in this manner across the screen looking for the end of the line. When found, it clears the last line and returns to Basic.

The location of the first cursor line CHR* is at 16521 and is set to 8; the location of the main cursor line CHR\$ is at 16532 and is also set to 8. The location of the trail left is at location 16538 and the last trail line is at 16547.

THE ZX-81 instruction set offers very little in the way of screen-controlling commands. To make up for this deficiency, these machinecode routines provide a variety of functions including flashing single characters or whole lines, a fast CLS, reverse scrolling and much more.

By far the easiest method of using machine code is to store it in a Rem statement at the beginning of a Basic program. Program 1 enables you to enter a group of machine-code instructions into the first line of the program, which can then be Saved, Loaded and used as part of longer Basic routines. Lines 10 to 80 can be removed once all the machine code has been entered - but under no circumstances should the Rem line be edited as this can remove vital instructions from the machine code.

Each routine can be used on its own since each is totally independent of the others, or they could all be entered together to form one large toolkit to be called at various points throughout a long Basic program.

Some of the routines require a Poke of some data before they are called - a line number to be deleted - and where this is necessary it is assumed that the data has already been checked for validity. For example, you cannot delete line 25 since it will cause the system to

Most of the routines are called by the Basic **RAND USR 16514**

where it is the first or only routine in the Rem

line. If you intend to use more than one at a time you will have to calculate the appropriate calling address by adding the length of previous routines to 16514.

As a convention I have used the label Start to indicate the calling point of each routine, and any bytes to be Poked are shown in relation to this. For example:

POKE START +5;

START = 16514

then

POKE 16519

To enter the machine code, type in program 1, counting carefully the number of Xs in line 1 - it may be best to enter them in Fast mode - and Run it. Then input the machine code in manageable blocks. Use the hex codes and watch carefully as you do it as mistakes are difficult to locate afterwards. When the code is finished enter S to stop the program.

These routines are for the ZX-81 with expanded display file - that is, with more than 3.25K of RAM - and they apply to the later ROM design. If some of them do not work it is because your ZX-81 is an early model and consequently you should change all occurrences of CD1D15 to CD1915. Additionally, if Scroll has been used to create the display then it must be cleared with CLS to recreate the expanded file, since Scroll collapses the display as if there were less than 3.25K present. Routine 10 will of course work with any memory size.

(continued on page 79)

nce upon a time.

.... in medieval days, there were dark, mysterious Forests, and within these Forests there lived mythical monsters called DRAGONS.

Now in 1982 when buying a computer you enter a technological Jungle; here within this jungle you will also find Dragons. But these Dragons are no myth.

SDRAGON 32 ONLY E199.50

PLUS £3 P/P

The heart of the system is a 6809E micro-processor, a great advance on the still popular 6502, with a 32K Memory as standard, expandable to 64K. Uses Extended Microsoft Colour Basic, 9 colours available, 5 resolutions of graphics up to 256 x 192, displayed on TV set or composite colour monitor. Generates a full five octave sound range through the TV Speaker.

Unlike other systems in this price range it uses a conventional QWERTY Keyboard.

Standard connections include: -

ROM Cartridge
2 Joystick controllers
Remote cassette unit
Centronics Parallel printer

160 page "BASIC" Manual included with every system.

All this for the unbelievably low price of only £199.50 including V.A.T, plus £3.00 post and packing.

Computers for All

20 BEST PROGRAMS for the **ZX SPECTRUM**

Mr HELPLINE — the man who answers your ZX queries in his column in Sinclair User, the author of HINTS & TIPS FOR THE ZX80 and HINTS & TIPS FOR THE ZX81 now presents his 20 BEST PROGRAMS FOR THE ZX SPECTRUM.

* 20 original programs for you to load into your Spectrum.

* 20 interesting programs for you to enjoy and learn from.

* 20 great programs to teach you about fixed and variable length.

- 20 great programs to teach you about fixed and variable length records, binary searches, bubble sorts, floating point arithmetic, graphic displays and much, much more.

 * 20 BEST PROGRAMS FOR THE ZX SPECTRUM.

Program Titles Include:

£29.90

£49.90 £79.00

f54.95

£59.80

£39.90

Index file -

Duckshoot -

Diary -

Machine code editor — Write, modify, exend and load machine code using this all-Basic machine code

editor. No need to use an Assembler when you have this program.

Learn about fixed length records, save numeric and string fields, add to, sort, modify, delete and print your records.

Ideal as a computer based card index. Learn how to manipulate the attribute

file and have fun at the same time. Binary searches and variable record

lengths are explained with this useful and interesting program.

PLUS: FOOTBALL, DIGITISER, DATA PLOT, FUNCTION PLOT, REGRESSION, HISTOGRAM, LINE RENUMBER and many more.

Z80 OP CODES

£1.45

A must for the beginner and the experienced programmer like. This hand ready reckoner lists all 600 plus 280 machine code instructions in decimal and hexadecimal with heir mincumonics. Each Op Code is succinctly explained and tross-referenced. Supplied in a protective transparent wallet or easy reference and durability.

ZX99

AUTOMATIC TAPE CONTROLLER FOR THE SINCLAIR ZX81

DATA PROCESSING

The ZX99 gives you software control of up to four tape drives (two for reading, two for writing) allowing merging of data files. This is achieved by using the remote sockets of the tape drives, controlled by USR statements or commands.

RS232C INTERFACE

The ZX99 has an RS232C output allowing connection with any such printer using the full ASCII character code (you can now print on plain paper in upper or lower case, and up to 132 characters per line) at a variable baud rate up to 9,600

SPECIAL FEATURES

There are so many special features it is difficult to list them all, for example:

AUTOMATIC TAPE COPY: You can copy a data file regardless of your memory capacity as it is processed through the Sinclair block by block.

TAPE BLOCK SKIP: Without destroying the contents of RAM DIAGNOSTIC INFORMATION: To assist in achieving the best recording settings.

The ZX99 contains a 2K ROM which acts as an extension to the firmware in the Sinclair ROM. The ZX99's ROM contains the tape drive operating system and the conversion to ASCII for the RS232C output.

There is an extension board on the rear to plug in your RAM pack (larger than 16K if required). The unit is supplied with one special tape drive lead, more are available at £1 each.

ZX99 SOFTWARE

We now have available "Editor 99", a quality word processing program including mail-merge, supplied on cassette for £9.95. Also following soon:

- * Stock Control (October)
- * Sales Ledger (November)
- * Debtors Ledger
- Business Accounts
- * Tax Accounting

Dept. YC5 Data — Assette, 44 Shroton Street, London NW1 6UG. 01-258 0409

● FERGUSON CASSETTE RECORDER £28 inc. p&p.

Tested with ZX81, Acorn, BBC, Dragon etc. etc. Features: Din, Ear, Mic. and Remote sockets, Tape Counter, Tone Control, Built-in Mic., Autostop. Battery/mains. Recommended by Acorn for use with BBC computer.

STAR DP8480
RS232C (SERIAL) £285 plus £6
Securicor delivery
CENTRONICS (PARALLEL) £265
plus £6 Securicor delivery

This professional printer works with almost any computer with very good upper and lower case typeface.

- Bi-directional 80 column width (10" paper)
- Switchable Tractor or Friction Feed
- 80 chrs. per second

• 2,000 SHEETS OF PRINTER PAPER £19.50 plus £3.50 p&p.

●E690 REVOLVING CASSETTE RACK

Single - £2.99 (holds 32 tapes or 20 in cases) Double - £5.99 (holds 64 tapes or 40 in cases) Treble - £8.99 (holds 96 tapes or 60 in cases) Quad - £11.99 (holds 128 tapes or 80 in cases)

All plus £1 p&p.

THESE COMMANDS have been left until last because of the problems they can create if not used carefully. Problems are the last thing you require when dealing with machine code.

This small group of commands is, for the most part, either extensions to previous commands or special operational commands.

Dealing with the extensions first, I previously stated that A was the only variable to which one of the other variables could be added or subtracted. It is also possible to add or subtract a constant.

 Basic
 Mnemonic
 Machine code

 LET A = A + 52
 ADD A N
 198 N

 LET A = A - 32
 SUB A N
 214 N

Remember A is single variable so that the constant has to be in the range of 0 to 255.

In the first article we mentioned the F variable, flag, and said that after certain operations it was tested for zero. In fact it is tested for rather more than that.

If the A variable is less than the value of the variable or constant with which you are comparing or operating then the flag variable C, carry, is set.

If the A variable is greater than, or equal to, the value of the variable or constant that you are comparing it with, then the flat variable NC, No Carry, is set.

In Basic terms where X is a constant or a variable:

Relation	Variable	Flags set
A = X	2	NC
A<>X	NZ	can be either
A <x< td=""><td>C</td><td>NZ</td></x<>	C	NZ
A>=X	NC	can be either

Now you can use these additional flagvariable relationships with your jump commands.

JP NC DIS 48 N JP C DIS 56 N JP NC NN 210 NN JP C NN 218 NN

We can also compare the contents of the A variable with either a constant or one of the other variables, code 184 to 190. The result of this will set flag variable Z if they are equal, or NZ if they are not, and the flag variable Carry, if A is less than the variable, and No Carry if not.

Basic	Mnemonic	
IF A = N THEN LET	CD N	code
F=Z IF A<>N THEN LET	CP N	255 N
F = NZ IF A> = N THEN LET		
F=NC IF A <n let<="" td="" then=""><td></td><td></td></n>		
F=C		

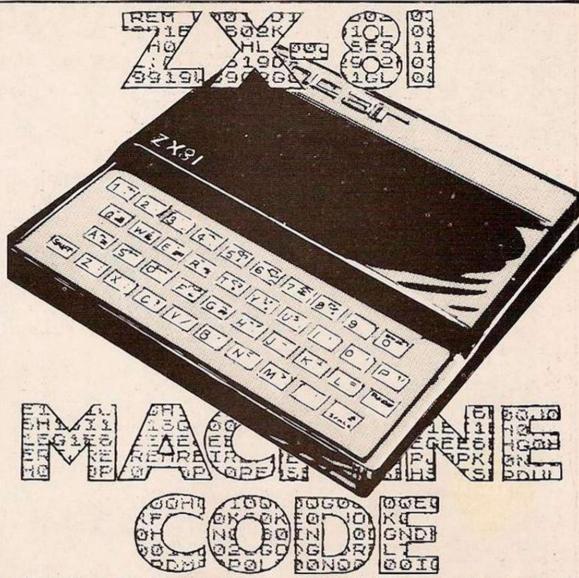

Note that the flag variable can be considered as a string rather than a number. Thus it is capable of holding the string NZNC, that is, non-zero, No Carry, if A is greater than the compared variable.

There is a group of commands similar to JP known as Call commands. The difference is that when you Call a return address is Pushed onto the stack. Later when a Ret instruction is met, the machine code Pops the return address off the stack and jumps to it.

CALL NN >>>>INC B LD (HL) B LD B A <<<< RET

Great care must be exercised when using Push, Pop and nested Calls, so that return addresses are not mixed up with Pushed and Popped variables.

Should your machine-code program ever fail

Kathleen Peel reveals some rather more problematical commands, which would have introduced unnecessary difficulties if mentioned earlier. These will enhance commands covered in the previous instalments of her machine-code series.

EXTENSIONS

to work, look at this first and ensure that for every Push there is a Pop within a subroutine, and that you have not Popped your return at the beginning of your subroutine.

Main Program	Subroutine
PUSH HL	LDAN
CAL NN	POP H L
	:
:	: :
	RET

Pop HL pulls the return address off the stack, not the Pushed HL. Remember, Pop pulls off the last variable pushed.

The Call routines can be made by the same relationships as Jumps.

CALL		NN	205	N	N
CALL	NC	NN	212	N	N
CALL	C	NN	220	N	N
CALL	NZ	NN	196	N	N
CALL	Z	NN	204	N	N

Now for some special functions that you may encounter.

XOR A

There is a simple way of making the A variable equal to zero — LD A 0 — and that is to use the mnemonic XOR A, Code 175.

EX DE HL

More can be done with the HL variable pair than with the DE pair. We can load a constant into HL, or any of the other variables. It is useful to be able to exchange the contents of DE and HL. The mnemonic is EX DE HL, Code 235.

AND A

With the Sinclair character code, the difference between a character and its inverse is 128. See page 181 of the Sinclair manual.

Therefore, if we just wish to know a character and not worry about its colour then by using the A variable we can mask off the colour by using the command And N, Code 230

And 127 blocks out the colour and just leaves the character, And 128 blocks out the character and just leaves the colour.

BIT 7A

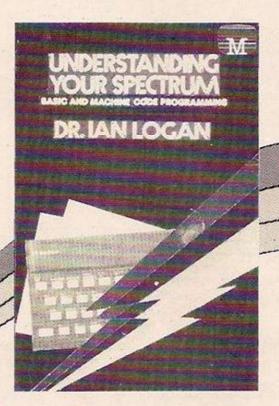

A related command is Bit 7, A, Code 203 127. This tests to see whether the 128 part of the character is there and sets the flag variable NZ if it is and Z if it is not.

This command does not alter the A variable, it only tests it and sets up the flag variable

according to the result.

Next month Your Computer begins a series of articles on machine-code chess. The range of code used has now been covered by the machine-code articles and this supplement. You will see how machine code can be used to produce fast compact programs.

ANNOUNGING The BEST Books For Your SPEGTRUM

Dr. Logan is acknowledged as the leading authority on Sinclair computers. In his book, he gives you a complete overview of the way the Spectrum operates, both for BASIC and machine language programming, including numerous demonstration programs. In Dr. Logan's own words UNDERSTANDING YOUR SPECTRUM has three main aims: "* to explain, in simple terms, how the Spectrum works; 'to teach Z80 machine code from first principles; and "to give details of 'monitor entry points' so that efficient programs can be written Plus a special section on the ROM operating system. This book is a must if you are serious about programming the Spectrum. £7.95

After leading the way in Sinclair ZX81 software, we've produced the highest quality, most exciting Spectrum software available. From the three excellent books depicted above to fast-action games on cassette, we're providing the best choice in Sinclair Spectrum software today.

Now on cassette all the programs from the Over The Spectrum book! Cassette 1 includes Lunar Lander, 3D-Mazeman, Chess and 7 more; Cassette 2 has 9 programs including utilities, Eliminator, Freeway Frog and a full scale Adventure. Cassette 3 includes Sales Analysis, Payroll, Spectrum Invaders, Meteor Storm plus 5 others. Each cassette is only £5.95 including V.A.T.

A book to amaze you! With the full listings of over 30 programs for your Spectrum you will find ready-made professional programs whatever your interest or application. Listings are printed in a specially designed easy-to-read format and each program has detailed notes. You'll find exciting arcade favourites, strategy games, utilities, business and educational programs, plus programming hints, tips on extending the Spectrum, and more, which all combine to make this the definitive book for every Spectrum user. Incredible value—over 160 pages including 8 pages in full colour. £6.95

SPECTRUM MACHINE LANGUAGE FOR THE **ABSOLUTE**

Edited by William Tang

If you are frustrated by the limitations of BASIC and want to write faster, more powerful, space-saving programs or subroutines, then SPECTRUM MACHINE LANGUAGE FOR THE ABSOLUTE BEGINNER is the book for you. Even with no experience, you will be able to discover the ease and power of the Spectrum's own language. Each chapter includes specific examples of machine language applications. At the end of the book, all this is brought together into an entire machine language program-from design right through to the complete listing of an exciting, original arcade game. £6.95

The new Dragon 32. So well designed, you'll even understand this ad.

If you're already a computer expert, may we refer you to the box of technical specifications displayed opposite.

If you're not, may we refer you to the new Dragon 32 Family Computer. A computer so easy to understand, you won't understand why all the others seem so difficult.

AndthenewDragon32costsunder£200.

32K RAM FOR UNDER £200?*

When you're comparing computers, the first thing you need to know is the size of the memory. In plain English, the Dragon has approximately 32 thousand units of Random Access Memory. (32K RAM for those who prefer to be blinded by science.) This means that the Dragon's memory is at least twice as powerful as its competitors.

With a memory this powerful, the amount of information the Dragon can store is literally vast. But the Dragon doesn't just make it easy to store information. It makes it easy to use, too.

USER-FRIENDLY?

You may have heard of the term 'user-friendly.' Reverting to plain English once more, this means simply that the computer will go out of its way to understand you, rather than vice-versa.

The Dragon 32 is so userfriendly, it practically licks your hand. You tap (literally) its vast resources through a beautifully-designed keyboard that's as easy to use as a typewriter.

On this keyboard, you type in a language which is surprisingly close to the English you talk every day. The Dragon 32 will receive

your order. Understand it. Send it to the appropriate section of its massive brain. And then display the appropriate information on your screen. All before you can say 'gobbledygook'.

	SPECIFICATIONS
The State of the S	6809E MICROPROCESSOR. Pet, Apple, Atari 400, BBC Micro, and VIC 20 still have the less powerful 6502.
1000	32K RAM (as standard). At least twice the power of similarly priced machines. Expandable to 64K RAM.
E 2000	EXTENDED MICROSOFT COLOUR BASIC (as standard). Featuring: ADVANCED GRAPHICS (set, line, circle, paint, print, draw, rotate and print using). ADVANCED SOUND 5 octaves, 255 tones. AUTOMATIC CASSETTE RECORDER CONTROL. FULL EDITING with INSERT and DELETE.
	9 COLOUR, 5 RESOLUTION DISPLAY.
	USE WITH ANY U.H.F. TV and/or separate P.A.L. monitor.
	PROFESSIONAL QUALITY KEYBOARD. Typewriter feel. Guaranteed for 20 million depressions.
	PRINTER (Centronics parallel).
	JOYSTICK CONTROL PORTS.

FIRE YOUR IMAGINATION.

Learning how to use the Dragon 32 won't cause you to experience any problems.

Learning what you can use it for will cause you to experience something entirely different.

Delight. Surprise. Fascination. And

challenge.

The Dragon offers a range of some of the most popular computer games in the world. From those celebrated space battles to mind-boggling adventures in seemingly unfathomable dungeons and caves.

As if by magic, a simple typed message will command the Dragon to create your own drawings. Then it will colour and paint them

in 9 colours.

And it's clever enough to create virtually any image you want - circles and arcs as well as straight lines.

The Dragon will also play and compose music with you, with a range of 5 octaves. And it works with any UHF TV or PAL monitor.

LEARNING THROUGH PLAYING.

All of this makes the Dragon the ideal machine to build your children's interest in the world of computers as they become increasingly more vital. School-children already enjoy using computers.

The Dragon is the first computer specifically for the family so by enjoying yourselves at home, you and your children can soon become expert enough to create your own programs.

BRILLIANTLY SIMPLE GUIDE.

The Dragon is living proof that you don't have to be an expert in computerspeak to be an expert in computers. It comes with the easiest-to-understand instruction manual ever written for a home computer.

Every step, every explanation, is made clear - even if you're a beginner. In minutes, it will show you how to write a simple program. Within hours, you'll be fascinated. And from then on, you'll continue to be astounded by the new world which the Dragon's power and versatility will open up to you.

See the new Dragon 32 in your High Street. At under £200, it's not just the first family computer. It also has all the features an expert could wish for.

Except perhaps the jargon.

DRAGON 32 The first family computer.

I	o: Jean Webster, Dragon Data Ltd, Queensway, Swansea ndustrial Estate, Swansea, Glamorgan SA5 4EH. Fel: 0792 580651.
P	lease send me further information about the Dragon 32.

PROJECT SIMPLE VAYS TO John Dawson casts a clinical eye over the winning entries in our

JOHN HEATH has won an Epson MX80F/T printer for a simple, but powerful device for putting information into a Sinclair Spectrum computer. Tony Higham, who is 17 years old, wrote a program to allow a disabled person to write Basic programs on the Tangerine Microtan computer, using only three keys or switches. He wins the under-18 section of the competition and will receive a BBC Micro. Sinclair Research has generously donated

competition to help the

disabled.

The competition rules stated that, in the under-18 section, we were looking for original and stimulating ideas, aimed at the practical needs of someone handicapped in a particular way. In the over-18 competition, we hoped to see a working, prototype device with some associated software. The idea was to encourage people to think about mass production of their inventions. Bright ideas in isolation are of little use.

three ZX-81 computers as special merit prizes.

No-one doubts that handicapped people's lives can be enriched via micro-electronics, but a discouragingly long catalogue of factors has limited their widespread application. When he built the pneumatic switch for the Spectrum, John Heath was aware of these problems.

People who are handicapped are disadvantaged as wage-earners, and support for the disabled is never high on the list of priorities for governments.

Although there are many disabled people, there is a conflict between the need to supply cheap, mass-produced aids, and the wide range of individual disabilities.

It is usually essential to adapt aids to the particular needs of the individual. If the customisation involves a health-care professional, costs rise dramatically.

Safety aspects

Maintenance of specialised, complex equipment installed at widely-separated sites throughout the country is also very expensive.

Very high standards of safety are necessary for electrical devices to be operated by handicapped people, who may be caught off-balance more easily than an able person. If the equipment uses mains power, simple aspects of the design such as the cord grips that hold the mains input wire may become much more important if users ever put all their weight on the anchorage between the wire and the

Figure 1 shows how John Heath plans to get a signal from a handicapped person using a simple rubber bulb full of air. When the bulb is squeezed, there is an analogue change in pressure in the pipe leading from the bulb. The tube is connected at the computer end to an adaptor which terminates at a diaphragm. Mylar film about 0.2 mm thick is an ideal material for the diaphragm, providing bidirectional motion in response to pressure changes.

A short rod or flag is attached to the centre of the diaphragm. This can be made to obscure a silicon photo-diode proportionally to the position of the diaphragm. The source of illumination is an infra-red light-emitting diode (LED).

A person pressing on the bulb will cause the diaphragm to bulge, thus changing the current flowing through the photo-diode.

The change in current through the diode can be detected by various circuits. One low-cost method of digitising the photo-diode current is to allow it to discharge a capacitor, and to measure the discharge time which will be inversely related to the current flowing through the diode.

Figure 1 shows how the software and hardware provide a binary on/off output from the changing pressure in the pneumatic actuator.

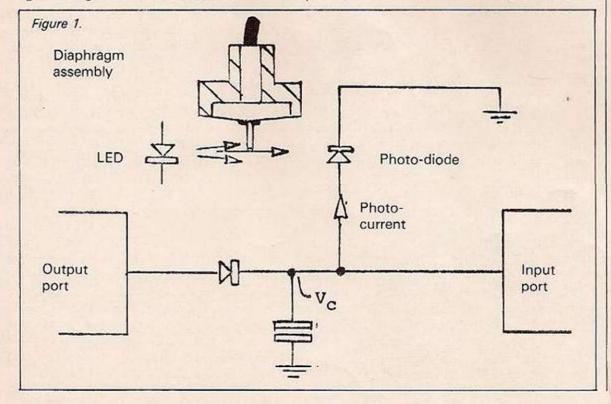

The computer is programmed to turn on an output Bit on one of the computer ports for a fixed period. The pulse provided by the computer charges the capacitor. During and after the pulse, the photo-diode discharges the capacitor, and the time that it takes for the voltage to reach a fixed low level, is determined by a program which reads in the input port continually, until it sees a signal that the Bit has dropped to the off — low level — state.

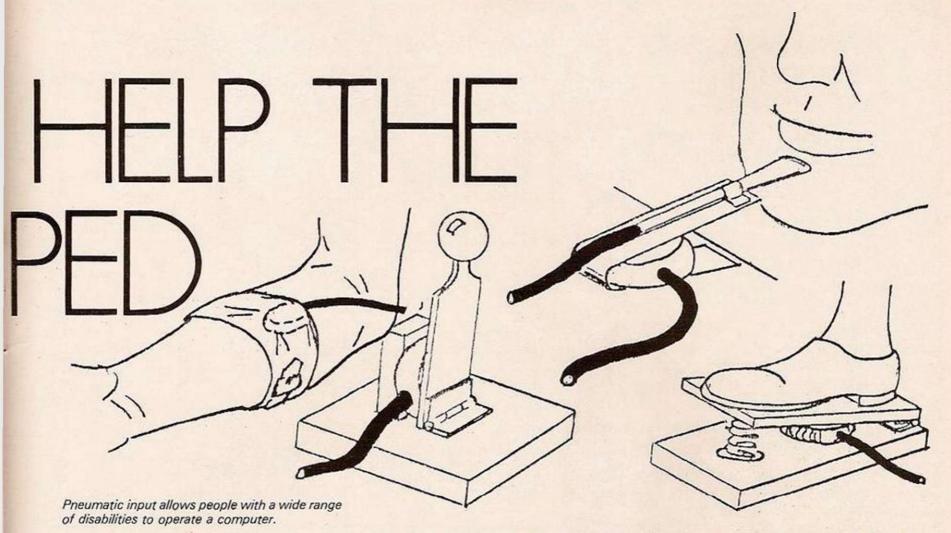

The input section of the program provides a digital measurement of the pressure in the tube by counting the number of times it has to go round in a loop while it waits for the state of the input latch to change.

Individual setting of the current flowing through the LED is necessary to compensate for variation in the sensitivity of the opto-electronic components, and the position of the components relative to the position of the rod attached to the diaphragm.

Existing devices for the handicapped are similar to other menu-driven data processing programs, in that the user controls the position of the cursor which moves among a selection of characters and commands.

John Heath's program makes the cursor go

forward by increasing the pressure in the tube, either by squeezing the bulb or by blowing into the tube. The user can choose commands by giving a short, hard puff down the tube in contrast to the lower steady pressure which makes the cursor move forwards. Because the pneumatic and opto-electronic parts of the switch are analogue components it is possible for the software to sense a range of pressures. This can be used to control the speed of the cursor. Negative pressure in the tube, caused by sucking, can be detected and used to move the cursor backwards.

John Heath found factors which were essential for the successful operation of the system. First, a significant margin must exist between the pressure giving fast cursor motion and the pressure that signals that a command or character is to be selected.

Secondly, when the user relaxes, the cursor velocity must fall to zero immediately if the user is to be able to operate the device at its fastest rate. Thirdly, the user should be able to adjust the response time of the system to suit the speed at which he or she can react. The speed at which a disabled person can use the system may vary from day to day, and the means of adjustment should be built into the software rather than designed as part of the hardware.

Keyboard aid

The program that 17-year old Tony Higham wrote was designed to help handicapped people to program a computer in Basic. He said that the program was to be used with a joy-stick or some other device to make operation easier for a disabled person.

When you run the program, the top-half of the screen displays a set of letters and commands which simulate the ordinary keyboard. Three keys control the movement of a cursor.

- 4 Move cursor to the left
- 6 Move cursor to the right
- 5 Select the letter or command beneath the cursor

Pressing the key to move the cursor to the right will transfer the cursor from the end of one line to the beginning of the next. When you select a character by pressing key 5, the letter appears on the bottom line of the screen and an asterisk character marks the point where the next character will be displayed. The user can select any of the keyboard functions, such as Return or Delete by positioning the cursor over the simulated Return or Delete keys.

Tony Higham built a shorthand command function into his program to increase the Basic writing speed. To get into the shorthand command program, the user types an Escape character by placing the cursor over the simulated Escape key. The asterisk character, which acts as a cursor on the bottom line of the screen, is replaced by S and then the keyboard can be used as before. When the user enters a single letter command, the complete Basic instruction is displayed on the bottom line.

Paul Coker developed a computer program to help people cope with dyslexia. This is an inability to gain access to information and to transmit it effectively to other people. Dyslexics cannot remember accurately the order in which letters are set down to form words due to the information about a word's structure being jumbled up between their eyes and their long-term memory.

Using a dictionary to check spellings, due to the complexities of the English language, is not always possible. For example, words like Know and No.

To overcome the problem Paul Coker wrote a program which he calls a Reverse Dictionary. The program will search for a correctly-spelt version of a word entered by the user. The average time to find the right match for a word typed into the computer is eight seconds if the first letter is correct.

If the first letter is wrong, the computer - A ZX-81 with 64K RAM - will take up to two minutes to find the word. Paul Coker says that his ZX-81 program is limited to 1,000 words as the tape take over six minutes to Load from cassette. A larger program could be used easily in a faster machine.

Help for dyslexics

I have not seen this program in operation, but the structure of the program appears to be divergent: more than one word might be taken to be a correctly-spelt version of the incorrect keyboard entry.

The single most telling point in this entry, and part of the reason why Paul won a special merit prize, is this: "My Reverse Dictionary is not meant to help a dyslexic to overcome the disability but to allow him or her to cope with it. The dictionary can be used in schools or colleges, but will be most useful at home where the person may not be able to get help with writing from a friend, and in cases where the writing is private."

I hope that as a result of the competition John Heath and Tony Higham will get together to combine their hardware and the software. Forth is a more powerful control language than Basic, allowing people who are handicapped to achieve a greater mastery of their environment. The health section of the IT 82 Committee will encourage the commercial assessment and development of the winning entries.

TIM HARTNELL Foreword by CLIVE SINCLAIR

REIFICIAIR PUTERGUIDE

INCLUDES OVER 20 PROGRAMS

by Tim Hartnell,

Editor of ZX Computing Magazine Forward by Clive Sinclair

In this practical guide — with programs throughout — Tim Hartnell takes his readers from their first steps in programming to how the ZX Spectrum can be used as a tool at home, at work and for education. He looks at the use of sound, colour and 3D graphics, and shows how to write programs in BASIC, as well as how to use machine code on the ZX Spectrum.

The ZX Spectrum Explored is complete with many programs for education, business and — not least — pure fun!

BASIC DICTIONARY

This dictionary, compiled by Tony Edwards, will explain the function of common Basic words as used in popular machines, enabling you to work out your own machine's equivalent. A useful complement to our recent series on Basic dialect translation.

BASIC DICTIONARY

CLG A function to calculate the base 10 logarithm of its argument. The argument must be greater than 0. On the BBC Micro this is a statement which clears the graphics area of the screen and homes the graphics pointer to 0,0.

CLK This function returns the date and time. An argument is usually required but it is a dummy playing no part in the function.

CLK\$ A similar function to CLK.

CLOAD A special command - which can also be used as a statement - found in Microsoft Basic. It loads a Basic program from a cassette. It is often followed by additional parameters identifying the cassette port and the program name.

CLOAD? Another Microsoft Basic command which verifies that the program stored in the memory is identical to that on a cassette tape. It may be followed by additional parameters identifying the cassette port and the program name.

CLOSE A statement used by many micros to close disc files. If no files are specified, it closes all files except in BBC Basic which uses CLOSE # 0 to close all files.

CLOG See CLG

CLR This may be used as a statement or a command and is used on the Pet and Apple II as an abbreviation for CLEAR. See CLEAR

CLS This is a command or a statement which clears the screen and homes the cursor without disturbing the program or variables. On the BBC Micro it only clears the text area of the screen. See CLG

CMD A command used by the Pet to control the IEEE device named by the argument.

CO An abbreviation of the CONT statement. See CONT

CODE The ZX series equivalent of ASC. Note however that these machines do not use standard ASCII Codes. See ASC.

COLOUR Also spelt COLOR on American machines. A command and a statement which identifies the code of the colour required to be used for output.

CON The Apple II abbreviation for CONT. See CONT

CONT A command used to restart a program which has been halted by BREAK or STOP. The program restarts from the point at which it has halted, with all variables intact.

COS A standard trig function which returns the cosine of the argument. The argument is normally in radians.

COUNT This is a BBC Basic function which returns the number of characters printed since the last new line.

CSAVE A special command - which can also be used as a statement - used by Microsoft Basic. It saves a Basic program on to a cassette. It must be followed by the program name and may also identify the cassette port.

CSNG A function which changes doubleprecision numbers and numeric variables to single precision. The double-precision value is not lost and can be recovered later.

D Used to indicate double precision when expressing numbers in standard scientific notation, exponential notation. For example: 1.23456789 D + 20

indicates

1.23456789 × 10²⁰

D. An abbreviation for DATA. DAT An abbreviation for DATA.

DATA A standard ANSI statement indicating that the rest of the line contains data to be read by a READ statement.

DEEK A similar statement to PEEK. It returns the value stored at the address indicated but in two adjacent addresses.

DEF FN A standard ANSI statement which allows the user to define his own functions. It can be simulated by using a subroutine which calculates the desired function.

DEFDBL A statement which defines the variables following it as double-precision variables, until redefined.

DEFINT A statement which defines the variables following it as integer variables, until redefined.

DEFSNG A statement which defines the variables following it as single precision variables, until redefined.

DEFSTER A statement which defines the variables following it as string variables until redefined.

DEG A command which causes trigonometrical functions to be operated in degrees rather than radians. It is also used as a function to convert radians to degree on some computers, including the BBC Micro.

DEL An abbreviation for the DELETE command.

DELETE A command which erases specified lines from the computer's memory.

DIM A standard ANSI statement which is used to specify the size and format of an array variable.

DIV A special function used by the BBC

BASIC DICTIO

Micro which returns the integer quotient of two variables, or expressions, which themselves need not be integers.

DO . . . UNTIL A statement pair which causes a loop of statements following the Do to be implemented until the loop ends that is, when the condition following the Until is satisfied. Control then passes to the statements on the following line. It can be faked with a For-To-Next loop. See Your Computer June 1982.

DOKE A similar statement to POKE but which places a two-byte value into adjacent memory locations.

DRAW This statement will draw a line from the current cursor position to a position specified by the co-ordinates following it, using the current foreground colour.

DRAW . . . AT This statement is used in Apple II Basic to draw the shape specified after DRAW in the position indicated after AT. The shape must have been previously defined and numbered.

DSP A statement used in debugging. It causes the line number and the value of variables indicated to be printed each time the program encounters them.

E Used to indicate exponential notation (standard scientific notation) for example: 1.01 E + 10 indicates the value 1.01 \times 10¹⁰ See also D.

E. The Microsoft Level I Basic abbreviation for EDIT.

EDIT A widely-used command to call up the machine's Editor so that changes can be made in existing Basic lines. There are many different Editors and each has its own command vocabulary. This command is used as a direct command and only very rarely finds a use inside a program.

ELSE A statement used to redirect the program operation sequence when the condition specified for an IF-THEN statement is not met. It can be mimicked by additional statements, see Your Computer September 1982, page 64, program 2 for details.

END The statement used to terminate execution of the program. In some computers it must be the highest line-numbered statement, but in others it can appear anywhere in the program and multiple ENDs are allowed. It differs from STOP in that it returns control to the Basic interpreter whereas STOP returns to the command mode. An ANSI standard word - See STOP.

NEW ZX SPECTRUM ROULETTE 48K

- •Full colour Monte Carlo betting table on continuous display.
- · Betting chip placement on table.
- Practically any bet can be placed.
- Suitable for 4 named players.
- · Good linear simulation of peripheral wheel numbers with realistic slowing down.
- Ball jumps around before settling.
- All winning numbers, even money, column and dozen bets automatically flashed.
- Each player informed of any wins and bank accounts automatically credited.
- Sound effects.

Tapes including full instructions for play, and postage and packing, obtainable for £4.95, from: -

ZX SPECTRUM 16K COMPENDIUM OF CHILDREN'S GAMES

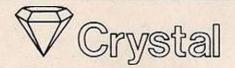

Tired of space invaders and games that go bang, bang? Make a change with Ludo, Snakes & Ladders, Beetle, Fox & Geese. No dice to lose or counters to pick up. Hours of family fun with these old-fashioned games updated for the space age. £4.95 inc. P&P

SPECIAL OFFER

Both programmes on same cassette

£8.95

DYMOND SOFTWARE, 22, HOSPITAL ROAD, ANNAN DG12 5HP, DUMFRIESSHIRE.

Innovative ZX Software

MERCHANT OF VENUS

(ZX81 + 16K RAM)

This absorbing graphics game combines the skill of 'Lunar Lander' with the judgement of 'Stock Market'. With your freighter you have the freedom of the skies above the cities and spaceports of Venus. Each area of the planet has its own market prices for goods and fuel and you must discover the most profitable routes to work. Careful trading can make your fortune, but beware — upkeep of your ship is expensive and poor landings could cost you heavily in repairs. Start trading today for only £5.95.

CRYSTAL MACHINE CODE (ZX81 + 16K RAM) MONITOR AND DISASSEMBLER

This comprehensive program takes all the effort out of entering, editing, debugging and running your machine code. Occupying less than 3½K above RAMTOP its features include:

- 19 one-touch 'keyword' commands
 A full editing system
 High speed LOAD and SAVE
 RUN with breakpoints
 A Hex-to-Decimal and Decimal-to-Hex converter
 Print, Tabulate and Copy blocks of memory
 Display and alter CPU registers

This essential aid for all machine code users is fully compatible with your BASIC programs and comes complete with a detailed instruction manual for only £8.95.

SYMMETRICAL CRYSTAL 1K GAMES TAPE

Simply the ultimate in 1K games. For flicker free fast action games all with on-screen scoring plus a challenging puzzle to solve:

ASTRAVOID

INVADERS BOMBER

Dodge the asteroids! Dock with Pods to refuel. How long can you survive?
Blast the advancing aliens before they land. Full screen display. Flatten the rocky wastes below to clear a landing strip for your damaged plane. Special HI-SCORE feature plus full screen display.

SUPER SLALOM DUNGEON QUEST

Can you beat the elusive 10 second barrier?

Dwarves, Trolls, Dragongs, Wizards and more! You must solve the hidden mysteries of the dungeon to free the imprisoned Princess.

Five great machine code programs for just £4.95

Send sae for our latest catalogue Please add £0.50 p&p and make cheques/ POs etc payable to

CRYSTAL COMPUTING 291-293 Station Road, Dunscroft **DONCASTER DN7 4DY**

PROGRAMMED & BLANK CASSETTES DELIVERY WITHIN A WEEK

Cassette 1 — BUSINESS MAN
This superbly interesting program will keep everybody from the most discerning company director to the tea-lady's grandchildren entertained for hours. Test your skill in the world of commerce. Make board room decisions on the future of your Company, on profit margins, manning levels, the Stock Market, in fact all the wheelings and dealings of the company executive.

A millionaire in 3 to 5 years? Or will you be calling in the receivers? Find out by playing BUSINESS MAN.

Side 2 — STARS MICRO CLOCK KILLER TANK PICTURE PAGE AMOLL INFO

Cassette 2 - MICRO PROFESSOR

This program is ideal for teachers and parents. Following the success of cassette 1 we now have a new exciting

and educational quiz program for 1 to 4 players to test their general knowledge. Each player has 5 questions randomly selected from a store of over 200 and these can be altered to, added to, up to 300. MICRO PROFESSOR takes up the entire ZX81 memory with the 16K RAM pack.

Side 2

Devise up to 300 questions and answers of your own such as pop music, sport, art, science, in fact - anything at all.

I enclose cheque/postal order f	Send your order to: AMOLL TECHNICAL, 56 BANKS ROAD, POOLE, DORSET. MR/MRS/MISS ADDRESS Tel Signed Date
& packing	

BIOPRINT

USE YOUR ZX PRINTER

Make ideal Christmas gifts for your relatives and friends who have everything!

Make a gift which is not only a calendar, but also a Biorhythm chart showing their cycles for every day of the year, all on beautiful Sinclair silver paper.

You need their birthdate, your ZX81, printer and BIOPRINT. Also for Spectrum! Buy BIOPRINT for £5.00 inc.

FISHER-MARRIOTT SOFTWARE 9c Abbey Hill, Kenilworth, CV8 1LW

RESPONSE FRAME

Do you have a problem? Your manual is incomprehensible or you just cannot get the hang of that programming trick you tried whatever it is, Tim Hartnell will do his best to answer your queries. Please include only one question per letter and mark them "Response Frame".

TV GRAPHICS

■ I own a ZX-80 and a ZX-81 which both work fine on a 14 in. black-and-white TV, but when I try them out on a remote control colour TV the picture is very grey and the graphics are unclear. Altering contrast and brightness brings little improvement. I am thinking of buying an Atari or Dragon with colour and sound, but I am reluctant to do so in case I cannot obtain a decent picture. Is the problem with Sinclair's machines, or the TV?

Wallasey, Merseyside. THE MOST likely problem is the ZX computers. Many do not produce an ideal picture on a colour television, although they work perfectly linked with a black and white set. To some extent the problem exists with all microcomputers. For example, my BBC Microcomputer works perfectly on my TV, but extremely poorly on a friend's set. You should not have problems with Atari or Dragon; there have been no reports regarding television-matching problems. Why not ask if you can have a demonstration of the computer on your own television?

POKE PROBLEM

■ I am the lucky owner of a Spectrum, but one problem causes me headaches. The display file, as you know, is a little weird. When trying to Poke characters to the screen I become lost.

Richard Baldwin, Harefield Road, Maidenhead. THERE IS NO simple answer. Why not stick with the Screens and Print At commands which do the job in a more simple manner?

COUNT THE DAYS

In your September Response Frame, Derek Chadwick asked for a routine for counting the days between specific dates. My subroutine does the job in three lines, most of the work being done by line 9530:

9500 REM DAY NUMBER ROUTINE 9510 LET M = VAL A\$ (4 TO 5) 9520 LET Y = VAL A\$ (7 TO)

9530 LET DAYNO = VAL A\$ (TO 2) + INT ((Y-1981) *365.3) + (1 AND (M >= 3 AND Y/4 = INT (M >= 3 AND Y/4 = INT(Y/4))) + (31 AND M = 2) + (59)AND M = 3) + (90 AND M = 4) + (120 AND M=5) + (151 AND M=6) + (181 AND M=7) + (212 AND M = 8) + (243 AND M = 9) +

(273 AND M = 10) + (304 AND M = 11) + (334 AND M = 12) 9540 RETURN

Line 9510 assigns the month number to variable M. line 9520 assigns the year number to Y. Line 9530 calculates the day number, using the first of January 1981 as a base, and allows for such things as leap years. The date must be entered as a string, AS, in the form 01.07.1982. I have found the routine useful in two ways. First, it can be used prior to sorting arrays into date order. Second, it can be used for Mr Chadwick's application. I have used it to calculate interest accumulated between two dates.

Gordon Clarke, Ruislip, Middlesex. THANKS VERY MUCH for your routine, Gordon. It is certainly compact, and looks fairly robust.

JOIN THE CLUB

I won a Vic-20 which I intend to expand to its full potential. However, I am having trouble finding out about peripherals. I am also interested in business software for the Vic. Where can I get some information on available products? S Knye,

Kids Grove, Stoke on Trent, Staffordshire. COMMODORE HAVE recently organised Vicsoft, their own club for Vic users. It supplies information on a number of products and services, along with members' discounts. You can get details and a catalogue, by writing to Vicsoft, 818 Leigh Road, Trading Estate, Slough, Berkshire.

A GOOD READ

■ I have a Vic-20 which I received at the beginning of the year. I have learned some Basic from Introduction to Basic 1, but now I feel I have come to a stop in my programming. Please could you advise me. David Murray,

Chelmsford, Essex. ONE BOOK I would recommend is the Vic-20 Programmer's Reference Guide, published by Howard Sams, for £12.50. Other books on the Vic include my own Getting Acquainted with your Vic-20, which is a first-time users' guide to programming, and the games book Symphony for a Melancholy Computer. Mark Ramshaw's book Zap! Pow! Boom! which has 30 arcade games for the Vic-20 may prove of interest. The Vic

Revealed, by Nick Hampshire, has been very popular. You can get it from your Vic dealer, or by mail.

VIC VOICE

■ I am a Vic-20 owner, and recently purchased a voice synthesiser. The notes on how to actually make it work using Read and Data statements are brief to say the least, but I have managed to incorporate it into many programs successfully. What I have been trying to do is allocate words or short phrases to certain keys, but either all the Data statements are read at once, or the first statement is read, no matter which key is pressed.

John Nicholls, Kingsley, Northampton. MICROSOFT BASIC includes the facilities of a selective Restore, which effectively acts as a pointer within lines of Data statements. What you need to do is incorporate the relevant Data statements for one word or phrase in only one line of Data. Then, to get just that line (if it was, say, line 2700) your key press will have to select a line saying Restore 2700 just before you Read. This should solve the problem. If you want it to stop Reading at a certain point, put a dummy value like 999 - in the Data statement, which the Vic can use as a stop indicator.

ROUTINE ENQUIRY

■ Having bought a ZX-81 to increase my knowledge of computers, I soon mastered its Basic. I then decided to branch out into machine code using Toni Baker's Mastering Machine Code on Your ZX-81 and have since then sold my ZX-81 and bought a Spectrum. I have made enquiries at various computer stores and have found out that both computers use the same machine code. What I would like to know is whether there are any books which give the addresses of the useful subroutines in the Spectrum ROM.

Zarek Langridge, Whaddon, Hertfordshire. TO MY KNOWLEDGE, such books do not yet exist. However, Melbourne House has a book planned by Ian Logan which discusses, among many other things, useful address of subroutines. Hilderbay has a booklet on making the most of the Spectrum ROM and I have received very favourable reports about this.

LIST LOOK

■ I have owned a ZX-81 for about a year now, and Your Computer has proved an invaluable source of information and inspiration for me. However, I have found several program listings difficult to read. One

example is the Landscape program by Gary Ownes in the September issue. It is very difficult to discern the difference between some of the numbers and letters, particularly 6, 8 and B in one of the strings. Also, I found the graphic characters in the Othello program in the June issue almost unreadable. Is there no better way of printing the listings, and if not, could a system of checking be introduced to ensure that at the final printing stages of the magazine, the listings can still be read?

Frank Warnes, King's Lynn, Norfolk. I AM GLAD that the magazine is proving a useful asset for your computing. The listing of programs is a constant problem for all computer magazines. It seems there are only two things that can be done. Either the listings can be reset, as the other material in the magazine is, and then printed, or a direct copy of the printout can be used. If the listing is set, it seems that no matter how well the proofs are read, errors will creep in. Using a direct printout produces the problems of legibility you mentioned. On balance, it seems better to use direct listings.

DRAGON SECRET

- After having used a ZX-81 computer for over 12 months, I would now like to buy myself a micro. I read with some interest about the Dragon 32 in Your Computer but having sent for the brochure, I feel some vital information has been left out:
- What is the speed of its Basic interpreter compared with the Vic-20, and is the 6809E processor superior to the 6502 as Dragon claims it to be?
- How many colours may appear on the screen at any one time?
- Does it have a white-noise generator and normal tone generators, and can they work independently of the screen so that on-screen action is not halted while the sound effects are in operation?

Peter Arnfield. Stockport, Cheshire

I DO NOT have the results of any benchmarks on the Dragon. The 6809E is a more modern chip than the 6502 which suggests it bears the fruit of later development. The number of colours you can use at any time falls as the resolution increases. You can use only two colours at once in the highest mode, but they are point by point colours, not grid colours as on the Spectrum. There is only a single channel for sound, and it is music, not white noise. If you want to get a good idea of what a Dragon looks like in action, go to a Tandy store and play with the Color Computer. It seems to me to have been built around the same extended colour Basic ROM written by the American company Microsoft, and in many respects could almost be described as the same machine - as in fact the Binatone computer promises to be.

A bigger range than the Himalayas

The Acorn Atom From £118 plus VAT.

Personal Computing - Instructional and Fun

To get the best out of personal computing you need two thingshardware that is powerful and reliable -software that uses the hardware to the full. The Atom range is just that.

The Atom-tried and tested

The Atom was designed to last inside and out. Outside a rugged, high impact case with a proper keyboard. Tested to withstand children as well as adults. Inside a powerful operating system that will never be bettered. It is available in several versions so you can choose what you want. And there is an enormous range of additional boards that fit inside the casing-start where you like - add more power, more versatility when you need it.

The Accessories-something for evervone

Diskpacks, printers, monitors, plug-in ROM's, manuals, other languages, arcade-type games, business and household software. Whatever you want to do - teach your children, run your business-you can't do better than choose the Atom range.

Available Nationwide

Not just mail order, the Atom range can be bought through a national dealer network-they will help and advise you. And in the unlikely event of breakdown they will be there. Like our

equipment Acorn Computers are here to last.

ACORN Acorn Computers Limited, Fulbourn Road, Cherry Hinton, Cambridge CB1 4JN Tel: (0223) 245200.

NGTRIPA

Fingertips is our regular calculator column covering calculator news, programming hints and examples of unusual applications. The column is written and compiled by calculator enthusiast David Pringle who is glad to hear of any of your ideas. Your Computer pays £6 for each of your contributions published.

A SOLUTION TO the Birthdays problem set in the September Fingertips column was sent in by Alan Stevens of Derby. This program for the Texas TI-59 gives the probability, Pr, that in a group of r people at least two of them have birthdays on the same day of the year by:

$$Pr = 1 - \frac{N!}{(N-r)!N^x}$$

where N=365, ignoring leap years. This can be rewritten as:

$$r = 1 \atop \pi (I - k/N) = 1 - Pr \atop k = 0$$

where Pi indicates "product of".

For a particular Pr the program below calculates the above product for successively increasing values of r, which is in STOre 00, until the product equals 1-Pr, or rather until the product is just less than 1-Pr.

product is ju	of 1699 finan 1 11
Address	Key
000	(
001	1
002	-
003	RCL 00
005	÷
006	365
009)
010	×
011	2nd Op 20
013	2nd x>t 000
016	RCL 00
018	R/S

Alan Stevens' Undercut.

Before running ensure that STOre 00 is zeroed, and enter the value of l-Pr in the t register.

	Enter	Press	Display
1		2nd CMs	0
2	1-Pr	x⊕t	0
3		RST	0
4		R/S	r

For Pr=0.6 we find r=27 people.

One may quibble that the x>t at address 013 should strictly be x>t, but this is not available on the TI-59. This may be overcome by using negative rather than positive numbers and INV 2nd x>t (= x<t), which requires three extra steps in the program. However, the likelihood of getting exact equality is so remote that there seems little point in doing it.

As well as this Birthdays solution, Alan Stevens has sent us Undercut, a calculator game based on a number game invented by Douglas R Hofstadter. It is for two players: here, the calculator is one player. Each guesses a number from one to five. If the two numbers differ by one, the player with the smaller number increases his score by the sum of the two numbers, the other player's score being unaltered. If the two numbers do not differ by exactly one each player increases his score by the number he or it guessed.

Thus, guessing a five will increase

your score significantly - unless your opponent guesses a four. Guess a one and you cannot be undercut but your opponent might guess more than two and hence score more heavily than you. Can you outguess the calculator over a series of trials? Needless to say, the calculator doesn't cheat.

Initialise the program by entering any number to be used as a seed for the random number generator, and press E. Then enter your guess - an integer in the range one to five and press A. Repeat the last operation for as long as you want to play the game. After each of your guesses the calculator guesses a number which it displays for about half a second. It then calculates and updates both its own and your score and displays the cumulative difference. If the result is positive you are ahead, if negative the calculator is ahead that is, it displays "player cumulative score calculator cumulative score".

The program turns negative guesses into positive ones, and takes the integer part of a non-integer guess. Other guesses outside the range one to five are rewarded by a flashing one - press CLR to continue.

The number of trials is not used by the program, but is recorded and may be found by pressing RCL 00.

The program uses the random number generator of the TI-59's master module. This puts the calculator in a fixed format state, so if the program is to be recorded on magnetic card, INV 2nd Fix should be pressed first.

Concerning Roy Sirl's TI-57 Probability Program, September, 1982, A M Simpson of Perth sent us the following table of timings achieved on his TI-58, using the two examples in the article:

	LOCS	EX 1	EX 2
A	92	140	145
В	63	43	50
C	75	15	8
D	80	12	6

Time in seconds

A is Sirl's program adapted for TI-58; B is Sirl's algorithm via library program 16; C is Simpson's program, user-defined labels version and D is as C but using absolute

An example of the latter is printed here, with some background notes, including proof of equivalence to Roy Sirl's algorithm.

As you can see from C above, A M Simpson's program should be easily adapted to run on a TI-57; it is for this reason that the four parameters

ADDRESS KEY 979 972 973 RCL 2ND IND 06 2ND X=T 012 000 2ND X3T 064 RCL 06 STO 11 976 978 995 **SUM 13** RCL 12 997 2ND PAUSE 989 SUM 14 INV SBR 011 RCL 12 982 RCL 10 912 984 2ND XXT 024 STO 10 2ND IXI 085 087 13 STO 06 917 919 921 924 GTO 028 989 90 STO 06 926 091 SBR 000 028 029 994 RCL 11 995 RCL 14 031 097 932 934 RCL 12 RCL 13 998 100 SUM 2ND IND 06 INV SBR 2ND LBL A 935 937 101 R/S 938 家 2ND IXI 2ND INT 949 105 2ND LBL E STO 09 741 042 STO 12 944 947 2ND X=T 102 .152 STO 01 .545 STO 02 .742 110 114 6 049 050 2ND XXT 102 2ND OP 20 2ND PGM 15 3BR 2ND D.MS 120 122 126 128 953 STO 03 .985 STO 04 955 132 134 957 959 STO 11 STO 05 CLR 061 062 CLR STO 06 135 137 2ND OP 26 STO 00 966 967 STO 13 STO 14 149 RCL 11

indicator

slauer's cumulative score

required by it still need to be entered outside the program.

TI-58/59 users, on the other hand, might find it easier to use userdefined labels to control entry of the parameters, and they should have no difficulty in developing A M Simpson's program into an automatic probability table generator.

Here are the background notes on A M Simpson's program. The algorithm used was:

$$P_{(r)} = \frac{(n-r) (a-u)_{a} (u)_{r} (u)}{u!_{n} (a)}$$

where: $x^{(y)} = x(x-1) \dots$ to y terms The proof of equivalence to Roy Sirl's algorithm is set out as follows, expressing 1 in factorials:

$$P_{(r)} = \frac{a! \ b! \ r! \ (n-r)!}{u! \ v! \ n! \ (a-u)! \ (b-v)!}$$

where:

b = n-a; v = r-u

Sirl's algorithm, using capitals to minimise confusion, is:

$$P(A,B,M,N) = \frac{C_{M}^{A} \times C_{N-M}^{B}}{C_{N}^{A} + B}$$

$$C_Y^X = \frac{X!}{Y!(X-Y)!}$$

(continued on next page)

Below: A M Simpson's probability

FINGERTIPS

(continued from previous page)

Expressing the above in factorials:

 $P_{(A,B,M,N)} = \frac{A! B! N! (S-N)!}{M! L! S! (A-M)! (B-L)!}$

where:

S = A + B; L = N-M

Therefore, the second and fourth equations are equal, as corresponding factors are identical:

Fourth Second

-		
S	n	The universal set;
		(=a+b)
N	r	The sample size;
		(=u+v)
A	a	No in n of required
		class;
В	b	n-a;
M	U	No in r to be of
		required class;
1		6-11

M J Robertson's program is for a Casio FX-602P and MP-10. It is designed to produce a sketch of a mathematical function.

To execute the program, the function required must first be keyed into P1 using Mode2. Then revert back to Mode1 and press P0. The program halts and asks for "x max". This is entered using EXE. The program then asks for "x min" and a similar procedure is adopted.

The program then asks for the Y Scale, the number of lines of output from the printer that you wish the

graph sketch to take up. Enter the appropriate value and press EXE. The calculator then responds with "points".

There are two options with this prompt, EXE or O EXE. Entering O EXE will produce a list of coordinates of the points to be plotted (the first pair of digits are for the far left column of the printer, and the last pair for the far right of the printer output). Pressing EXE only leads to the calculation of the coordinates: they are not printed. When all the points have been calculated the calculator responds with Ymax. This facility allows the breaking up of a curve into several parts.

If the maximum value of the part of the curve you want is known, by differentiation, entered, and EXE pressed then that value will be used. Hence if you divide a curve up into equal parts in relation to the x axis, then you can enter these one by one

and the Y scale will be the same for all of them. This enables a long, or more accurate, curve to be produced since the resulting output can be linked side by side, each with the same scale.

However, if you just wish for a single curve to be produced, just pressing EXE after the Ymax prompt will result in the calculator automaticaly taking the maximum value it has just calculated and using that to determine the scale. Having entered the appropriate response to Ymax, the calculator will then set about plotting the graph as desired.

Mode .40 must be used. This allows only nine steps for P1, however if a larger function is required some of the alpha comments can be temporarily deleted.

The following programs by T Briggs were designed for the ambitious occasional punter aiming for big returns. Program P0 provides a quick and accurate calculation of Yankee bets in which all combinations of two or more horses are covered. The stake is entered first, followed by the number of horses to be covered. The display then shows the number of bets involved.

When the results are known, the odds of each winner are entered. Non-runners are entered as 0, losers as -1. After the final entry is made, the profit or loss is displayed followed by the amount to be collected from the bookie, including stakes.

Program P1 is designed for calculation of straightforward multiple bets, doubles, trebles and unlimited accumulators. As in the previous program, the stake and number of horses are entered. Results are keyed in, after which nett and gross returns are displayed, followed by the cumulative total of winnings if more than one bet is made.

Example of $Y = -x^2$ with co-ordinates displayed.

Functional cassette software by Dale Hubbard Buy 2 at £19.95 - take 1 at £5.95 FREE!!!

DATABASE

The program that everyone needs. Facilities include sort, search, list, delete, change, totals, save file, one print if required, etc, etc. Can be used in place of any card index application.

£19.95

STOCK CONTROL

All the necessary for keeping a control of stock. Routines include stock set up, user reference no., minimum stock level, financial summary, line print records, quick stock summary, add stock, delete/change record,

£19.95

MAILING LIST

A superb dedicated database to allow for manipulation of names & addresses & other data, with selective printing to line printer. Features include the facility to find a name or detail when only part of that detail is known. Will print labels in a variety of user-specified formats.

£19.95

DECISION MAKER

A serious program that enables the computer to make a sound decision for you based on various criteria. If you want to buy a car, hi-fi, house, etc., or you don't know which woman to marry then you need this one.

£5.95

INVOICES AND STATEMENTS

Ideal for the small business. A complete suite of programs together with generated customer file for producing crisp and efficient business invoices and monthly statements on your line printer. All calculations including VAT automatic and provision for your own messages on the form produced. *Not Spectrum

£19.95

RUBIK SOLVER

It's not our policy to offer games but we make an exception here for a program to solve the cube from ANY position. Shorthand notation makes learning the solution by heart possible for most active brains.

£12.95

THE CATALOGUER

This dedicated database is ideal for use in any situation where a catalogue could be utilised. E.g. stamp collection, coins, photos, slides, books, records etc.

£19.95

COMMERCIAL ACCOUNTS

A gem of a program, all for cassette, with the following features:

Daily Journal Credit Sales Cash Sales Credit Purchases Purchases - other Sales Ledger Purchase Ledger Bank Account

Year to Date Summary

A fully interactive program suitable for all businesses. Files can be saved and loaded and totals from one file carried forward to another on cassette. Particularly useful from a cash flow point of view, with an immediate accessibility to totals for debtors and creditors. Bank totally supported with entries for cheque numbers, credits and, of course, running £19.95 balance.

HOME ACCOUNTS

£19.95

Runs a complete home finance package for you with every facility necessary for keeping a track of regular and other expenses, bank account, mortgage, H.P. etc etc etc!! You'll wonder how you ever managed without it.

CHOPIN - LES ETUDES

Six beautiful studies from Opus 10 and 25 performed for you live by Mr. Computer. Spellbinding!!! £5.95 *Not Spectrum

MOTOR ACCOUNTANT

Find out exactly what the car is costing you and keep a data file with all your expenses therein!

RECIPE FILE

Let all those computer widows have a bash! The wives will realy enjoy the fun of this program designed to keep all her recipes. Will even suggest a menu for the day/week! Excellent value.

All programs supplied with exhaustive documentation. Send cheque or P.O. or Cash (registered) or Credit Card no. to:

Gemini Marketing Ltd

DEPT. YC10 9 SALTERTON ROAD, EXMOUTH, DEVON EX8 2BR.

Or telephone us with your credit card order on (03952) 5832 All orders despatch by return - no waiting. All prices include VAT and post & packing except Hardware. Full range of Sharp peripherals available - please 'phone for quotations. Please state machine type and memory size when ordering software.

Submarine

M Fox, Aldridge, West Midlands.

377-31

THIS IS A complex game of naval strategy in about 12K of RAM, based on a visual map of the area of battle and is an excellent example of the use of multi-dimensional arrays for the storage of certain types of data.

You are the captain of a submarine attacking a horde of enemy ships at anchor in a lagoon. You have to destroy them without running out of power, being destroyed by depth-charges, eaten by sea monsters, hitting a mine or running aground. The game is relatively selfexplanatory when being played but the actual commands do need some explanation.

First, you may move in any one of eight directions using the command 1:

8 1 5 4

100 power moves you one square. You must be careful not to ram anything when moving. After you move, the sea-monsters also move this is done in fast mode to save time. During this process **BADOOM** represents the demise of a sea-monster on a mine.

Second, you have two options for the command 2, Sonar. Option 1 draws a map of the battle area, in which:

- Edge of the battle area
- Mine
- Your submarine

- S Enemy ship
- Your H Q
- Sea monster
- Island

The second Sonar option enables you to track the path that a torpedo or missile would take. It prints a list of the things that it would

Torpedoes, command 3, is used to launch a torpedo which has a range of three. They cannot destroy islands. Missiles, launched by command 4, have a variable range and use fuel. 100 fuel is equal to one square range. Missiles can destroy islands but ignore sea

Command 5, Repairs, is a command enabling you to repair damage - though it does use some power. There is a Status/Damage Report command. The Headquarters command, number 7, enables you to get extra supplies and power. It can only be used with over 16 enemy ships and you must be within two squares of your HQ.

Command 8, Sabotage, is a useful way of getting rid of enemy ships, and has a range of two. Conversion is used to convert fuel to power or power to fuel, at a one to one exchange rate. This is command 9. The symbol 0 gives a list of the commands. If you enter a wrong command Break the program and Goto 240. It is advisable to start games with a map.

The map is held in the array A(15,20) and is set up in lines 10 to 140. If the number 0 is held in the array then the corresponding square on the map is empty, 1 represents a mine, 2 your submarine, 3 an enemy ship, 4 your HQ, 5 a sea monster and 6 an island. This enables the printing of the map to be a very easy process - a string is set up containing the symbols used for each character on the map, line 2055

LET A\$ = "*XSHS\$ + "

Then that string is sliced and the character from the section of the string of the value of that square of the array, +1, is printed lines 2052 to 2150.

All the inputs wherever possible are done by Inkeys to make the game easier and more pleasant to play. The crew, power, fuel, torpedoes and missiles are located at lines 160 to 200. Lines 230 to 260 input your choice of command and 270 to 290 print the possible options. Damage is kept in the variable D(9) corresponding to the command option. Damage is caused by the enemy depthcharging you after the commands Movement, Torpedoes, Missiles, Sabotage and Conversion. This is done at 6200 onwards to 6640 where a varying degree of damage is selected and inflicted from No Damage, 6260, to Critical Damage, 6490, where you have to send Help in a code which is printed on the screen for one second then removed - if you get it wrong no help comes and you die. The time can be changed at line 6550. You may find that you need 100 - two seconds - to start with, but later this will become too easy. After every command where damage is received, 1,3,4,8 and 9, the damage is automatically repaired by 1 at 5200.

Lines 1000 to 1080 collect the information for movement - direction and distance; 1090-1190 move the submarine checking if it hits anything and making sure that it does not go off the edge. Some clever manoeuvres can be devised making use of this facility. If you hit something when moving line 1160 sends

(continued from previous page)

you to 1200 which prints the message.

After Movement, the sea monsters move. These home in on you by one square each time. This is done in Fast mode at 5210. It scans the board square by square, 5240-5260, and when it finds a sea monster it homes him in by one square, 5270-5320, and if he has landed safely it saves his co-ordinates in B number of sea monsters found so far, 1 - and B(A,2) then removes the old image, 5450-5470. If a sea monster lands on a mine both it and the mine are removed from the map, 5530-5550. If it lands on you then it eats your whole submarine and you lose. If it lands on anything else it is replaced in its old position and does not destroy it. Sea monsters can be blocked this way and it is a good strategic move. At the end of this process lines 5570-5600 restore the re-positioned sea monsters to the map.

Lines 2160 to 2270 produce the torpedo or

missile tracking by searching an area of three squares all around you in horizontal stripes going down.

The torpedo routine at 3000 is used for both torpedoes and missiles, 3030 to 3070 checking the area, in the same way as 2160-2270, and 3100-3160 printing the appropriate message. The short section at 4000 merely sets up missiles before jumping to 3030.

At 5000-5050 is the damage-repair routine. A status report is printed at 6000; 7000 is the HQ facility resetting your power and fuel. The sabotage routine is 8000. It checks an area two squares around you and destroys a random selection of the ships in that area around you. At 9000 is the conversion routine for converting fuel to power and power to fuel on a one-to-one basis.

Due to its immense size and the heartbreak if it is lost after typing it all it, it is best to save this program twice. This takes about four

minutes each when finished. Remember to Clear the variables when saving, as these can add another minute to the time. This is done by 9900-9930. Do not forget to put in line 6475, which is at the end of the listing. To make the game harder or easier you can alter the original power, line 170; fuel, line 180; torpedoes, line 190; missiles, line 200; crew, line 160; ships, line 10; mines, line 50; sea monsters, line 70; and islands, line 80.

The variables are: A(15,20) is the map; ZC is the flag for whether to move sea monsters or not - 1 means yes, 2 means no; S represents number of ships left; S1+S2 are the co-ordinates of your submarine; S3+S4 are the coordinates of your HQ; D(9) is damage; P is power; F is fuel; C is crew; T is torpedoes; M is missiles; D is whether or not an HQ is allowed to be used - 1 means yes, 0 means no; P1,A,N,X,Y,M,R\$,G\$,A\$,V,W,Z+SC are general usage variables.

Alien shootout

Steven Lilley, Rearsby, Leicester.

DRAGON

THIS KIND of program uses quite a few interesting features available on the Dragon 32

computer, such as music and colour. The object of the game is to use the small laser base at the bottom of the screen to shoot the aliens which appear one at a time on or near the top of the screen.

First, you are asked what speed you require between 1 and 10. It is best to start at about 2. Then, there is a short pause, long enough to get to the operating keys. The keys used are A to go left, S to go right and L to fire.

The variables are D for score, S for your speed, Q for your primary laser-base position, T for aliens position, M1\$ for your laser-base and M2\$ for the aliens ship. The program only takes 724 bytes, so it can be expanded and modified many times over.

Random graphics

Jack Schofield, London W3. ATARI

THE ATARI micros have some 37 graphics characters, but these are not used as often as they might be, because the implementation is odd, not to say bizarre. They can be entered from the keyboard, though they are not marked on the keys, by pressing the CTRL key at the same time. But when these characters are used in graphics modes 1 and 2

as double-width and double-depth characters, different ones appear from the ones you typed in. Unless, that is, you have also remembered to change the character-set base to the graphics characters by using

POKE 756,226

Another way to go is to print CHR\$(Y)

for each character you want. Table 9.6 on page 55 of the Basic Reference Manual tells you which is which.

This also lets you change the colour of the

character shown by adding 32, 128 or 160 to the CHR\$ number. This simple graphics routine illustrates the technique. Line 10 sets Mode 2 without the text window. Line 15 sets the character base for lower-case and graphics characters.

The loop simply fills the screen with random examples. Lines 55 and 60 display the same graphics character, Y, but in three different colours — yellow, Y, magneta, Y+128, and blue, Y+160, respectively.

The program loops forever so press Break to stop it, and type End to stop the sound.

```
10 GRAPHICS 2+16 50 Y=INT(RND(0)*20):SOUND 1,Y,10,8 15 POKE 756,226 55 PRINT #6;CHR$(Y);:SOUND 2,Y,10,6 20 FOR X=1 TO 64 60 PRINT #6;CHR$(Y+128);CHR$(Y+160); 30 Y=INT(RND(0)*30) 65 NEXT X 70 GOTO 10 45 PRINT #6;CHR$(Y+32);:SOUND 0,Y,10,8
```

Dodgems

Nagaraj Jayakumar, Royton, Oldham.

773-20

THE FOLLOWING PROGRAM is for the

Commodore Vic-20 with 3.5K and is an arcade game. You are driving a car and the computer is driving another car chasing you. There are five lanes in which you can manoeuvre. The object of the game is to stay alive as long as possible before the computer car crashes into you.

01 — 09 Rem statements 10 — 13 Sound tune 14 — 25 Instructions 200 — 290 Set up board 340 — 610 Movement of cars 800 — 890 Searching for car 900 — 960 Ending routine 1000 — 1080 Change of lane

ZX Spectrum 20 Programs £6.95

The ZX Spectrum has brought advanced computing power into your home, The Cambridge Colour Collection, a book of 20 programs, is all you need to make it come alive.

No experience required. Simply enter the programs from the book or load them from tape (£2.95 extra) and run.

Amazing effects. All programs are fully animated using hi-res graphics, colour and sound wherever possible.

Entirely original. None of these programs has ever been published before.

Proven Quality. The author already has 30,000 satisfied purchasers of his book of ZX81 programs.

Hours of entertainment

- Lunar Landing. Control the angle of descent and jet thrust to steer the lunar module to a safe landing on the moon's surface.
- Maze. Find your way out from the centre of a random maze.
- Android Nim. Play the Spectrum at the ancient game of Nim using creatures from outerspace.
- Biorhythms. Plot the cycles of your Emotional, Intellectual and Physical activity. Some would say this is not a game at all.

Improve your mind

- Morse. A complete morse-code training kit.
 This program will take a complete beginner to R.A.E. proficiency.
- Maths. Adjustable to various levels, this program is an invaluable aid to anyone trying to improve their arithmetic.

Run your life more efficiently

- Home Accounts. Keeping track of your finances with this easy-to-use program will enable you to see at a glance where the money goes and plan your spending more effectively.
- Telephone Address Pad. Instant access to many pages of information.
- Calendar. Displays a 3 month calendar past or future, ideal for planning or tracing past events.

ZX81 16K RAMPACKS

WHY NOT buy now, one of the super new RAM PACKS from GROUND CONTROL? The standard version gives 16K of user ram, while the (S) version is fitted with a keyboard sounder enabling much faster entry of programs and less eyestrain due to audible feedback every time a key is pressed. The well engineered case ensures a snug fit to the 7X81

AVAILABLE NOW WITH

Availability is usually by return for credit cards, 5 days for cheques. There is a 14 day money back guarantee if not satisfied. Please send SAE or IRCs with all enquiries.

Make cheques/P.O.s. payable to GROUND CONTROL and send to: GROUND CONTROL, Alfreda Avenue, Hull-bridge, Essex SS5 6LT.

Tel: 0702-230324. (Mon-Fri 9-5)

Slalom

Jonathan Yeomans, Solihull, West Midlands.

SPECTRAL SKI-ING involves a slalom skier manoeuvring down a course to the finishing post. The graphics are printed by a Read and Data statement on to the screen and Bin statements allow the user to use the high-resolution graphics.

A full set of instructions is contained in the listing, along with Rem statements to tell the user what the computer is doing. Lines 5-40 set up high-resolution graphics; lines 40-80 print out the board; lines 80-160 get the skier moving and lines 160-210 are the ATTR lines that detect if you have hit anything that you should not have.

Lines 300-320 are for when you hit a flag; lines 400-420 are the routine for when you hit a tree and lines 500-530 are the routine for when all your skiers have bitten the snow.

Lines 800-840 are the instructions; lines 900-940 are the routine for when you have finished the course; lines 9000-9030 are the data for the Bin statements, and lines 9030-9040 are the data for printing out the course.

The graphics used are: lines 40 and 50 graphics D, line 60 graphics B, line 80 graphics A, line 115 graphics E, line 125 graphics A and line 190 graphics C and F.

Atom squash

Robin Ager, Wimbledon, London SW19.

ATOM

HERE IS A simple, but smooth and fastmoving, game of squash for the Acorn Atom. It only uses 1K of graphics memory to allow it to Run in a small amount of memory. To make the program even more compact, full use of the Atom's abbreviated commands should

be. Use the Q and R keys to control the bat up and down the screen in order to hit the ball against the wall. Due to the bat being curved the ball will be deflected at steeper angles when it hits the far top or far bottom of the bat.

The score is kept by the line at the top of the display, which increases until the target score of 110 is reached. If your three balls are used before you reach this score, the score you have achieved will be displayed at the end of the game.

Set up arrays
Assembler keyboard scan
Set up court display
See if keys are being pressed
or if ball is at edge of court
Move ball
Control vertical bounce of ball
See if ball hits or missed bat
and acts accordingly and
controls horizontal bounce of
ball.

End of game routines

Soft key

Robert Rancans, London SW1. 836

THE USER-DEFINABLE keys on the BBC Micro can be used to implement useful functions during every programming session by employing this short program.

To start, use the 11 highest line numbers the operating system will allow — 32757-32767 — and assign the desired command to each key

32757 *KEY0L.|M

32758 *KEY1VDU14|M 32759 *KEY2VDU15|M 32760 *KEY3CLS|M Page mode on Page mode off Clear screen 32761 *KEY4AUTO

32762 *KEY5RENUMBER|M 32763 *KEY6MODE7|M

32764 *KEY7REM 32765 *KEY8*CAT|M

32766 *KEY9RUN|M 32767 *KEY100LD|ML.|M Enter your starting line and increment

More convenient as it combines CAT with a motor-on facility for rewinding tapes, press Escape to cancel

To get out of tricky situations when Escape is treated as an error Note that you do not have to use quotes when assigning keys. Save this, preferably on a new tape so you can locate it easily. To check the operation of the program press Break twice quickly, rewind the tape and Chain "Soft-keys" or whatever you have called it. Now type New and start entering your main program, making use of the soft keys. Do not press the Break key before typing New as, for some odd reason, the first line number of the soft-key program will then appear on the screen as line 245.

The commands will remain active after pressing Break once. To enter a new program without clearing the soft keys, type New — obviously you must not use the highest line numbers in your main program.

Pascal functions

D M Woolley, Hathersage, Derbyshire.

M3-30X

USERS OF SHARP MZ-80K Pascal are probably missing the Set/Reset graphics functions provided by the Basic. This assembly-language program fills that gap. Those with less than 48K will have to adjust the origin approE\$CFAA ; reserve space for routine

: return to monitor

LOAD etc.; load routine from tape and control returns to Pascal

Set X,Y can now be accessed by Call (-12373) X,Y and Reset X,Y by Call(-12356)X,Y.

It is probably best to incorporate these in procedures to aid clarity and to allow X and Y to be constants, thus:

Procedure Set (X,Y: Integer);

CALL (-12373) X,Y END:

An easier way of converting hexadecimal addresses greater than \$8000 to decimal (2's complement) than shown in the Pascal manual is to first convert the hexadecimal directly into decimal, and then to subtract 65536.

Users of Basic SP-5025 may be interested in INP# port, variable and OUT# port, data. These are not in the manual and are the I/O port equivalents of Peek and Poke.

Graph screen

K G Staller, Birkenhead, Merseyside.

713-20

THE GRAPH-PLOTTING procedure for the Vic-20 published in April's Your Computer produces a graph whose size is limited by the need to cover the whole area of the graph with high-resolution graphics. Here are two programs that overcome this difficulty and produce screen-size graphs.

The first program uses instructions given in Your Computer October 1981. These prepare

the computer to use high-resolution, userdefined graphics. It also defines the character for axes.

This program, having been Run and Cleared from the computer by typing New, makes way for the graph-drawing program. It produces screen-size graphs by defining new characters only when the line or curve passes through a screen location. Thus most of the screen is filled by blank characters.

The desired functions can be inserted at line 240 as Y=f(x). On Running the program, four input parameters must be given: first, XL value of X where the plotting of the curve starts; second, XH - value of X where the plotting of the curve ends; third, XM - value of X at the edge of the screen; fourth, YM value of Y at the edge of the screen.

For XM≥XH, XM≥XL, and XH>XL care must be taken to avoid trying to plot impossible points, for example, √-1 or 1/0.

No compensation is made in the program for the fact that, due to the shape of the screen, n units in the y direction are shorter than n units in the x direction.

I have used this program to draw many different functions on the screen and hope that you find it of interest. I am uncertain as to why what should be one-bit dots on the screen appear as short lines.

You waited long enough for your Spectrum! Wait no longer for . . .

SPECTRUM STORM-FIGHTERS

. . . explosive machine code space action

They come from deepest space.

An alien fleet whose skill is matched only by its ruthlessness. They hide and manoeuvre in the cover of asteroid clouds. showers of cosmic rubble that spell death on collision to the commander of the lone space ship that protects Earth. You are that commander.

In one of the toughest challenges the Sinclair Spectrum can offer your mission is to destroy the aliens and avoid the asteroids before they destroy you.

Your weapon is a twin firing laser canon. Double bolts of pure energy that mean instant annihilation to on-target aliens. Its

responsive. Its fast. But only as fast as you are.
Put yourself at the controls. On the thrilling edge of adventure. the STORM-FIGHTERS await you.

All machine code action . . . full colour graphics . . . full sound sync . . . progressive difficulty . . comprehensive scoring . . . high value mother-ship . . . runs automatically on both 16K and 48K

Available on quality cassette atom £4.95 (post free in U.K.)

John Prince 29 Brook Avenue, Levenshulme, Manchester, M19 3DQ

. . . the reason the BBC was delayed!! For only £5, the most complete arcade game yet for the 12K Atom, featuring: one/two player games; progressive hi-score; animated score-table, and theme-tune; full colour

Mode 4a bit-wise graphics; and for the first time -

INTERNAL/EXTERNAL SOUND OPTIONS!

That's right! You can put the sound through the stereo!! "Makes Astrobirds look like a bunch of geriatrics" A.C.D., Leeds Orders despatched first-class same day. Supplied on high-quality cassettee, with full documentation Mail order only. Cheques made payable to:

ADDICTIVE GAMES at: Dept. Y.C. P.O. Box 278 CONNIBURROW, MILTON KEYNES MK14 7NE

PLEASE STATE COMPUTER

We're tired of telling you how good our game is.... let our customers tell you

I received F.M. about 10 days ago, and heve played about 23 hours so far — addictive is the operative word. —

D. BLAIR, FIFE

think your game is fabulous since starting with Port Vale in the 4th Division, being promoted, winning the F.A.

C. DICKENSON, CANTERBURY

recently bought your F.M. program and was very pleased indeed. I found it very good value for money and played it all day the day it arrived — I own a ZX81 which is now only used for F.M.— Yours addicted, M. FRAMPTON,

CANVEY ISLAND

I felt that I had to write and congratulate you on your program F.M. I found the game very compelling and exciting, real-ly just like the real thing — keep up the good work and standard.—

N. LAWRENCE, FULHAM ORIGINALS CAN BE SEEN ON REQUEST

for only £199.

Line drawing

Richard Matthews, Harlow, Essex.

77-99/3

EXTENDED BASIC on the Texas T199/4A computer is easy to use and has many facilities, including sprites. However, one useful facility is lacking: the ability to draw high-resolution lines from point to point on the screen. The program described here allows high-resolution line drawing and is based on the computer's ability to redefine characters.

An important feature of Extended Basic is subroutines that can be called by name at any point in a program. The line-drawing program is written as one of these subroutines so that it can be attached to the end of other programs. The routine may be called at any time by the statement Call Plot RW,CL,RW1,CL1,CT. This would allow a line to be drawn from position RW, row, CL, column, to position RW1, row, CL1, column. The Texas screen has a resolution of 256 by 192 pixels and in this routine screen position 1,1 is in the top left-hand corner.

In simulating a line-drawing function it is necessary to redefine the character allocated to a screen position before each new pixel of a line is plotted. Each character consists of an eight-by-eight matrix of pixels and the character must be redefined to include the newly-plotted point while preserving the existing pattern of that character. Another limitation is the limited number of characters that are available for redefinition. In order to preserve the existing ASCII character set for text it is necessary to start at ASC-96, so this routine should only be used for certain plotting tasks. It is an excellent means of drawing line graphs.

The variable CT in the Call Plot statement is to indicate where within the character set you wish the characters to be redefined. In the example shown, the starting place is ASC-96 and thus CT has the value 96. When 48 characters have been used there are no more available characters to redefine, and so line 275 instructs the program to start again at ASC-96. If more characters are required then CT could be altered to 33, but then the standard ASCII character set will be overwritten. The variable CT need only be set once at the beginning of the program.

Lines 100 to 160 are not part of the linedrawing routine, but are included to show how a line can be plotted. In this example, a line would be drawn from screen position 2, 20 to position 7, 60. The line-drawing routine is called from line 130. Line 190 assigns values to array Bin.

The process for calculating the path to be taken by the line is shown in lines 210 and 240. Line 250 calculates the character position on the screen that contains the pixel which is being plotted. The Texas screen has a character size of 32 by 24.

Line 260 calculates the position within the

character of the pixel that is being plotted. Call GChar in line 270 finds out which character already occupies this position on the screen. If that screen position has not yet been used then the ASC value of 32 is returned and this indicates that a new character must be assigned to this position and so CT is incremented by 1. Line 275 checks to see if all the available characters in the character set have been used.

The Call CharPat statement in line 280 — the CharPat sub-program is built into Extended Basic and returns a string that identifies the pattern of a character code — creates in variable x the pattern of the character code found at the screen position already identified.

Lines 290 to 330 modify the character code to allow for the new point that has been plotted. Line 290 identifies the position within the string identified in line 280 of the hexadecimal value that must be modified. Lines 300 to 320 convert this hexadecimal value to a decimal value and the logical operator Or is used in line 310 to redefine the plotted point while preserving the existing pattern of the character.

After conversion back into hexadecimal the string X in line 330 is updated to allow for the change and the new modified character is created and displayed in line 335. The For-Next loop continues until all the points making up a line have been plotted and then control passes back to the main program by way of line 340.

BBG

THIS PROGRAM produces a piece of computergenerated animation for the BBC Micro and shows the use of both colour and block graphics in the teletext mode - as featured in June's Your Computer.

Lines 10-80 initialise the program and plot

the background colour using CHR\$(157) which produces a solid line of colour across the screen for the blue of the sky and green of the fields. Line 90 calls a routine to draw clouds in the sky, lines 480-520, and produces between one and eight clouds in random positions in the sky. This creates a different pictures each time the program is run. Line 100 calls a similar routine to draw a hut on the

The main body of the program, lines 100-330, produces the sound effects for the train as it passes across the screen and also

produces the control for the speed of the train, iines 140, 190, 270, 320. The position of the train is then plotted using the routine at lines 360-430. Lines 370 and 380 plot a solid line of colour across the screen producing the animated effect. Lines 390 and 400 plot the train itself in red, and then line 420 will produce puffs of smoke from the train at various positions across the screen using the routine ProcChuf.

The overall effect is a very colourful and amusing program. The reader could try adding further items to the scene.

Lissajous effect

Stephen K Wilson, Oakes, Huddersfield.

BBG

WHEN TWO sets of waves produce a geometrical shape a Lissajous figure is created. This program simulates this effect as produced on an oscilloscope screen. With the instrument's time-base off, one oscillating

signal is connected to the X plate and one to the Y plate. If the frequencies of these signals are in a simple ratio a recognised symmetrical figure is formed. In physics these figures are used for determination of an unknown frequency through comparison with a known one. The nature of the figure depends on the path difference between the signals. With the simplest of all ratios - 1:1 - the figure is a sloping line with a path difference of 0 rads, a sloping ellipse with a path difference of one

quarter of the rads, and a circle with a path difference of half of π .

In this simulation the user is asked to input the ratio of frequencies in lowest terms, and the path difference between the signals - X signal leading Y signal — as a fraction of π . The computer calculates and draws the figure.

The program will run on either BBC model, though those with model Bs would wish to alter line 15 to run it in mode zero for greater (continued on next page)

SOFTWARE FILE

(continued from previous page)

resolution. Those with greater patience and a greater desire for accuracy might wish to reduce the Step command at line 100.

With a view to converting to other Basic dialects it is worth mentioning that @% is a formatting feature which displays all figures to two decimal places. The VDU 28 call defines a

text window at top-centre screen which is cleared by the VDU 12 call and cancelled with VDU 26, line 95. *FX 15,0 clears the keyboard buffer, line 25.

Program name

Alan Went, Colchester, Essex.

23-31

EVERYONE MUST at some time have recorded a program on tape and forgotten to label the cassette. To find out what the program is, it must be loaded, which on the ZX-81 with a full 16K program can take 10 minutes. This routine, which takes up about 90 bytes, will read the name that you gave the program, in a few seconds, without loading it, and without destroying the existing program.

The routine is a modified version of the ZX ROM Load routine, but whereas the ROM only uses the name to compare the program on tape against the program name given after Load. I have modified it to print the name on the screen.

Line 1 consists of a Rem line containing 74 characters into which Lines 10 to 70 Poke the machine-code routine. After running the program as listed Lines 10 to 70 should be deleted and Line 10 added:

10 RAND USR 16514

To use the routine start the tape-player then Run. The normal waiting-to-load pattern will appear on the screen. A few seconds after the program load patterns appear, the program will stop with the program name on the screen.

It is advisable to keep the name as short as possible but up to 90 characters can be used.

Note that Line 10 in machine-code loader is:

10 LET A\$ = "CD230FCD8A4018FB0E0106003 E7FDBFED3FF1FD2A2031717381110F1F1CD 8A40CB7A792001D71730F4181DD51E94061 A1DDBFE17CB7B7B38F510F5D12004FE563 0C83FCB1130C3C9C9S"

After running the program as listed, replace Lines 10 to 70 with:

10 RAND USR 16514

```
@F5D12004FE5630C83FC81130C3C9C95

20 LET X=16514

30 IF A$="5" THEN STOP

40 POKE X,16*CODE A$+CODE A$(2)

-476

50 LET X=X+1

55 PRINT A$( TO 2);" ";

60 LET A$=A$(3 TO )

70 GOTO 30
```

Spiral clear

Gary Nugent, Churchtown, Dublin, Eire.

233-31

SPIRAL CLS was written for a 16K ZX-81. It clears a 22 by 32 screen. The screen is first filled by a spiral of inverse spaces, and then by a spiral of spaces. The screen is then ready for

output, the Print position having been reset to 0,0.

The routine is in machine code and is 91 bytes long. It should be entered into a line 1 Rem statement using any of the hexadecimal loaders that have been in previous issues of Your Computer. The code is not relocatable. Should you wish to move it, all the Call addresses will have to be changed.

This is a novel way to clear the screen and is

faster than the system CLS when large amounts of memory and Scroll are in use.

Poking address 16599 with a value less than 192 increases the speed of the spirals. A larger value decreases the speed. To make the routine clear a 24 by 32 screen, do as direct commands:

POKE 16535,23 (21 for 22 × 32 screen) POKE 16575,9 (11 for 22 × 32 screen)

The routine is called by Rand USR 16514.

SOFTWARE FILE

Double-height

Paul Evans. Clapton-in-Gordano, Avon.

SPECTRUM

THIS PROGRAM produces double-height characters from a 48K Spectrum.

Line 5 changes RAMtop to reserve memory for the new character sets. There are two new sets, one for the top half of each character, and one for the bottom half.

Lines 10 to 110 load the two character sets above RAMtop. This part of the program only needs to be run when the program is loaded: it does not have to be run each time a doubleheight character is printed.

Lines 9800 to 9920 print out text contained in a\$ in double-height characters. Note that a\$ should contain only ASCII characters, i.e., those with a value less than 128.

If you own a 16K Spectrum the following changes have to be made: 63830 in line 5 has to be altered to 31062; 63831 in lines 100 and 9820 changes to 31063; and 64599 in line 9830 changes to 31831. To print the text loaded into a\$ type Gosub 9800.

I have discovered that the command Open# 2,"p" causes all text created by a Print statement or List command to be diverted from the TV screen to the printer. Sometimes this is more useful than keying LPrint to use the printer. The statement Close#2 makes things revert to normal.

Magic circle

Stephen Skinner, Billingham, Cleveland.

DISTIGATION IN

THIS PROGRAM for the standard 32K Dragon demonstrates the use of the circle command. Four circles are drawn, each at a 90° displacement. In turn, each radius of the four circles decreases by a small amount until they form point. Sound is also included to add a bit of sparkle to the demonstration.

Mystery

Allister Dann, Sleaford. Lincolnshire.

ZX-31

THESE PROGRAMS are for the 1K ZX-81 alone. Tempting as they might seem to 16K owners, the RAM pack must be removed.

Program 1 should be entered first and then Run. When the inverse L appears, enter 62,-166,237,71,201 where the commas represent Newline.

You will have to try it to see what this program does, because it is very hard to describe. Suffice to say it produces graphics never before seen on a ZX-81.

Enter program 2 very carefully, and use Run 100. Then, wait. The screen is filled with peculiar characters. Wait until three-quarters of the screen is filled, and then Wham!

To revert to the normal graphics mode, use New. Repeat this procedure, changing the -166 to -122 for even more spectacular results.

The cleverer ones amongst you will have

realised that program 1 can be entered as a series of direct Poke commands. The format I have used is simply the one I like best. For fun, trying changing the -122 to another number.

Program 3 was discovered by accident. The Poke command gives you 34 columns as opposed to the standard 32. Use line 1 with other programs to increase screen size.

10 FOR A = 17000 to 17004

20 INPUT I

30 POKE A,I

40 NEXT A 50 LET C=USR 17000 Enter 62,-166,237,71,201.

Program 1.

100 LET A = INT(RND*255) + 1 200 PRINT CHR\$ A; 300 GOTO 100

Program 2.

10 POKE 16441,20 20 PRINT "AB"

30 GOTO 10

Program 3.

Scroll clear

lan Bland. Northampton. 2X-31

WHILE MESSING AROUND with my 16K ZX-81 I found a way to make the screen Clear quickly after Scrolling. Normally, a CLS command or a return to non-Scrolled Printing takes a long time because the display has to be padded out with spaces on the expanded machines. This program will illustrate this:

10 FOR N = 1 TO 22

20 SCROLL

30 PRINT"TEST"

40 NEXT N

50 CLS

See how long the CLS command takes. The trick is to artifically pad the display file on each scroll, by using a Tab to move the Print position to the end of the line. To show this, change line 30 in the program to:

30 PRINT"TEST"; TAB 31; and Run the program again. By forcing the ZX-81 to print a full line of 32 spaces each time, the display file remains intact.

MEMOTECH Explores the Excellence of your ZX81

MEMOTECH KEYBOARD

- Memotech's Plug-in ZX81 Keyboard

- Plugs simply into system without modifications to your ZX81
- Keys have Sinclair legends
- High quality typewriter keys
- Does not inhibit other add-ons
- Automatic hold-down repeat
- Complete with buffered interface
- Fast and easy entry
- Switchable between configurations

Memotech's Memopak Range-

Current Memopaks 16H 32H 64H 6HHG

MEMOPAK 64K MEMORY EXTENSION

The 64K Memopak extends the memory of the ZX81 by 56K, and with the ZX81 gives 64K, which is neither switched nor paged and is directly addressable. The unit is user transparent and accepts commands such as 10 DIM A(9000).

Breakdown of memory areas...0-8K Sinclair ROM. 8-16K This area can be used to hold machine code for communication between programmes or peripherals. 16-64K A straight 48K for normal Basic use.

MEMOPAK 32K and 16K MEMORY EXTENSIONS

These two packs extend and complete the Memotech RAM range (for the time being!) A notable feature of the 32K pack is that it will run in tandem with the Sinclair 16K memory extension to give 48K RAM total.

MEMOPAK HIGH RES GRAPHICS PACK

HRG Main Features — • Fully programmable Hi-Res (192 × 248 pixels) • Video page is both memory and bit mapped and can be located anywhere in RAM. • Number of Video pages is limited only by RAM size (each takes about 6.2K RAM) • Instant inverse video on/off gives flashing characters • Video pages can be superimposed • Video page access is similar to Basic plot/unplot commands • Contains 2K EPROM monitor with full range of graphics subroutines controlled by machine code or USR function

MEMOPAK CENTRONICS TYPE PARALLEL PRINTER INTERFACE

Main Features — • Interfaces ZX8I and parallel printers of the Centronics type • Enables use of a range of dot matrix and daisy wheel printers with ZX8I • Compatible with ZX8I Basic, prints from LLIST, LPRINT and COPY • Contains firmware to convert ZX8I characters to ASCII code • Gives lower-case characters from ZX8I inverse character set

COMPETITION CORNER

CAT-FIGHTER

BY ANTHONY ROBERTS

CAPTAIN T'WI is on a suicide mission inside the automated Wo'ny defence zone, with the entire force of between 2,000 and 2,100 homing cat-fighters after him.

T'wi has only a single-lensed F'lix disintegrator to start with, but fortunately every time it is used to destroy a cat-fighter the resultant sub-etheral interference disables the rest of the force just long enough for T'wi to raid the Wo'ny supply asteroid and pick up two more lenses and fix them to his disintegrator. The weapon will destroy as many catfighters as it has lenses. Unfortunately, any lens not aimed at a cat-fighter, but which hits one, automatically self-destructs - taking everything within 100 square AUs with it. Two lenses aimed at the same cat-fighter have

Of course, T'wi makes it out after totally destroying the cat-fighter force; and gets the maximum number of precious F'lix lenses: how many cat-fighters, and lenses? Here's a chart of the action.

Competition results

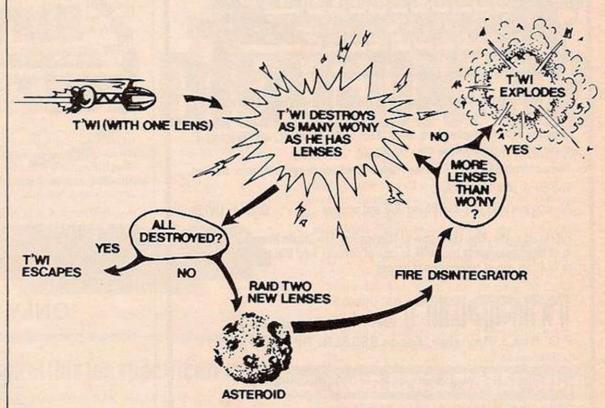

WE RECEIVED more than 100 correct entries for September's Jailbreak problem - considerably more than in previous months. There were in fact three solutions: entry at 00.03 hours for an escape with one prisoner, entry at 00.21 hours for two prisoners, entry at 15.40 for three prisoners. Most people reasonably assumed that the preferred solution was the one in which the most prisoners were released.

Some entries took a mathematical approach, based on the fact that the number of beads must be the sum of an arithmetical progression. But most programs simply searched for those times that fulfilled all the conditions.

We considered programs that contained two loops, for hours and minutes, neater than

A £15 book token will be awarded to the first correct solution drawn from the competition bag. All entries must be at the Your Computer offices by the last working day in November. The name of the winner, the solution, and a competition report will be published in the January, 1983 issue of Your Computer.

If you want to set a competition for Competition Corner, remember that the simplest solution should be calculable by a short program rather than by any other form of reckoning.

programs that used a single loop, Time = 0 to 23.59, since the latter tests non-existent times like 12.70.

From the handful of entries which took the first line we awarded the £15 book token to S Beadle, 44 Mendip Avenue, Hillcroft Park, Stafford ST17 0PG. He noted that his ZX-81 took just over eight minutes to solve the problem in Fast mode.

Our September competition for a NewBrain computer asked entrants to complete the sentence "I need a Newbrain because . . ." and large number of entries complained that

their old brains were worn out with the effort of solving the crossword. Other pleas were that their brains were too small, unable to cope, storm-damaged, jaded, bug-ridden, out of memory, over-taxed and crashed.

A Morgan put it this way: "My old brain can't take the strain of failing again"; while C Shires reported with disarming candour "My present one cannot think up witty slogans to win competitions". Moved by such plaintive cries, we gave the prize to M White, 41 Monville Road, Fazakerley, Liverpool L9 9DE, who wrote "It's probably my last chance to get a head in computing".

Several people needed a NewBrain because as P Marfell said "This is the age of the Brain"; D Lewis confessed "I have a mania for such crania" and D Bull revealed that "Igor dropped the last one on the laboratory floor".

Solution to the September crossword.

REM JAILBREAK SOLUTION BY S.BEADLE FOR H = 1 TO 24 10 FOR M = 0 TO 59 20 LET P = 1 30 S Beadle's program to solve 40 LET G = 0 the Jailbreak problem. LET B = M + 100*H 50 LET B = B - G 60 IF B > 0 THEN GOTO 200 70 IF B = Ø THEN GOTO 100 80 LET G = G + 190 95 GOTO 60 LET P = P + 1 100 IF P = G THEN GOTO 150 110 LET B = G 120 LET G = 0 130 140 GOTO 60 150 PRINT H; "HRS. "; M; "MINS. "; P; "PRISONERS" STOP 160 200 NEXT M 210 NEXT H H = HOURS G = GOLD COINS VARIABLES: M = MINUTES B = BEADS P = PRISONERS

A full-size, full-travel 43-key keyboard that's simple to add to your ZX81 and requires no soldering in the ZX81.

Complete with the electronics to make "Shift Lock", "Function", and "Graphics 2" single key selections making entry far easier.

Powered from ZX81's own standard power supply—with special adaptor supplied. Two-colour print for key caps.

Amazing low price only £19.95 incl. VAT and carriage.

PASCAL FOR THE **ZX SPECTRUM**

Hisoft are pleased to announce the availability of Hisoft Pascal 4 for the 48K ZX SPECTRUM.

No longer do you have to put up with the slow execution speed of BASIC programs; Hisoft Pascal 4 produces programs that run between 40 and 100 (yes 100!) times faster than the equivalent programs written in ZX SPECTRUM BASIC. For example, a program to sort a 100 element array of numbers into ascending order takes 60 seconds in BASIC, while HP4 produces a program which does the same thing in 0.6 seconds!

NOW you and your children can learn to program in an efficient and structured way by using Pascal, the favoured language in schools and universities

NOW you can write games programs etc. which run as fast as you need them to without having to resort to assembler or machine

NOW you can use a language which requires minimal re-learning when you move from your SPECTRUM to another computer; Hisoft Pascal 4 has all the essential features of Standard Pascal as detailed in the Pascal User Manual and Report — by Kathleen Jensen and Niklaus Wirth, the man who designed Pascal.

Hisoft Pascal 4 is a professional piece of software designed by a team who have been writing Pascal compilers for many years—you will find it to be powerful, flexible and very easy to use.

To top it all, we are offering the package (which includes a 60 page manual), for a limited time, to 48K ZX SPECTRUM users at an INCREDIBLE price of:

ONLY £25 INCLUSIVE

We won't be beaten on

SPECTRUM is a rapidly expanding group of independent retailers who specialise in selling home computers. Our group policy is simple – WE WON'T BE BEATEN ON PRICE! – our BULK BUYING ensures this. We select and buy the best and pass the savings on to YOU, the customer. We GUARANTEE that if you find an item currently advertised and in stock at another dealer and at better price than ours - WE WILL MATCH THAT PRICE ON THE SPOT.

Only trained personnel at Spectrum!

We believe that our product 'know-how' is crucial to you the customer. That's why in every one of our centres you'll find fully trained personnel, who have been trained by the importers or distributers themselves know and understand the products we sell and can help every customer even the complete beginner. At SPECTRUM we find the RIGHT equipment to suit your needs. Handing over sealed boxes is not our line - our service includes 'hands-on' experience that we pass on to YOU.

After Sales care

SPECTRUM service centres will ensure that should your machine 'go-down' we will get it running again as quickly as possible. We also offer extended warranties at reasonable prices too!- ask your SPECTRUM HOME COMPUTER CENTRE for full details.

ZX Spectrum - ZX81

In 1981, ACS Software published ACSEMBLER and DIS-ACSEM. These are now generally regarded as quite simply the best assembler and disassembler programs available for the ZX81.

"The disassembler... is really fantastic." A.M., London "I am very pleased with the assembler and I feel that you have a real winner in this program." R.B., Gloucester Your programs are first class. Looking forward to more." A.J., Norway.

"... the single biggest step to proficiency in machine code programming." SINCLAIR USER

Now, with the superior facilities of the ZX Spectrum, ACS Software have done it again. Ultraviolet and Infrared are assembler and disassembler programs that will extend your Spectrum. Look at the facilities that Ultraviolet offers:
Works entirely in decimal (no hex problems); all Z80 instructions correctly assembled; supports the pseudoinstructions EQU, ORG (multiple ORGs allowed), DEFB, DEFW and DEFS; code can be assembled at one location and then relocated; allows alphanumeric labels of any length; full listings of assembled code and mnemonics can be output to the printer; full error trapping with faulty instruction clearly indicated; comments can be included in the source file.

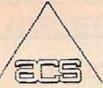

So now there is no need to be intimidated by machine codewith Ultraviolet and Infrared it's child's play! Buy them from the machine code specialists - ACS Software.

ULTRAVIOLET - £7.50

INFRARED - £6.75

ng programming aids are available for the 16K ZX81 at £5.50 each. SAE Prices include postage and packing for UK orders, overseas clients

ACSEMBLER: DIS-ACSEM: ACS DEBUG: PROGSTORE: TOOLKIT: PROGMERGE (version 2): TAPEKIT PROGMERGE and TAPEKIT won't make a Spectrum out of your ZX81 but they will give it some interesting new facilities!

FOUR NEW VIC ADD-ONS FROM ADI

Light up with VicRel. VicRel is a control relay that plugs straight into the Vic user port to give simple, programmable switching of electrical apparatus in the home, office or factory. Its six relay outputs can control door locks, lamps, valves, tools, ventilators. And

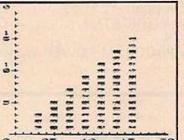

two inputs allow the Vic to read signals from external sources such as thermostats, push buttons or light activated switches. VicRel eliminates black boxes full of wires and represents one of the most exciting, valuefor-money, firmware additions to any Vic computer system.

£28.95 INC VAT

Plot away with VicGraf. This cartridge allows you to explore the complicated equations and functions of graphs. The menu screen, activated by the Vic's special function keys, will automatically plot a graph, define new functions, calculate accurate values of an intersection, find the maxima and minima of a function. Simple editing allows you to check current functions and to change them. A necessary and attractive addition to any educational situation where graphs need to be explored.

£28.95 INC VAT

Crunch & Display with VicStat. A plug in cartridge that undertakes statistical calculations—such as Meanvalues, Standard deviations and Variances—and displays using single commands. Other one word commands allow you to draw vertical and horizontal bar charts,

to plot graphs, and to specify the scales and the colours used by these commands. It will also sort numeric and character strings. Finally, all or part of screen displays can be copied to the Vic Printer.

VicStat comes complete with a detailed operating guide.

£28.95 INC. VAT

The VicForth plug-in cartridge, complete with 3K of additional memory, takes programming into new dimensions. As both

an operating system and program development aid VicForth can speed up program writing and speed of operation.

VicForth is based on fig-Forth and is almost identical to Pet Forth. It does however support the Vic cassette deck—an unusual feature. For those who do much programming a Vic Disk unit is suggested. VicForth provides several hundred one-word commands—listed in the detailed £38.95 INC VAT

user guide—that can be added to

IT'S MORE FUN EARNING WITH VIC

If you are over 3 years old, and still young enough to hit the keys, then these new VIC programs are for you.

From top software publishers ASK, they let you learnand laugh about it too.

Fabulous graphics. Demanding ideas that make learning lots more fun.

All on cassette at £8.95 inc. VAT.

TWISTER. Designed to improve concentration and logic. Rearrange a geometric puzzle-abit Rubik cube-likeso that no row or column contains a repeated colour. There can be from 3-10 columns and if you cannot get out of it, Twister will do it for you. For really clever users you can go into the Super-Twister mode where you must arrange the squares so that no diagonal, as well as row or column, contains the same coloured square. This is so difficult that the computer does not give you the answer! Supposedly designed for age 8 upwards.

NUMBER CHASER. Designed to improve estimating and multiplication skills for 5-12 year olds. A carrace where you move against the computer according to your skill at estimating the given sum. We forget that in the age of the calculator estimating is important to see if your

computer, calculator etc has come up with the right answer.

Number Chaser has superb graphics and sound—you would not want more than a few of these in a classroom at any one time since the level of excitement, as well as learning, is very high.

FACEMAKER. This is designed to improve spelling, to expand vocabulary and also sharpen observational skills. Designed for 5-12 year olds this is an interactive program where you draw people's faces.

Superb graphics that—like most of these ASK programs—fill the monitor or TV screen and are not restricted to the normal VIC format.

A beautifully crafted piece of software that will find many applications in school and at home. It will also be of special benefit to people teaching children who are slow to learn to read.

WE WANT TO COUNT. This is a program for children of three years and upwards who want to learn numbers and to count things correctly. There are four parts in the

program with games-type graphics. In two of these you can select levels between one and five. This program has been designed to be extremely simple to operate so that, once loaded, children can use it entirely on their own.

ARCADE QUALITY SOFTWARE FROM LLAMASOFT!! Spectrum **ATARI 400/800** by Jeff Minter

GRAPHICS/CHARACTER CREATOR

Now you can define your very own custom character sets. Or edit the existing sets. Results fully displayed on screen in mode 0, 1 and 2. Many exciting features including: Save, Screen Modes, Reflect, Invert etc.

Supplied on cassette with data £8.00 + 50p pftp.

SPECTRUM SUPERDEFLEX
The idea of this new game is to bounce 'SID' the space invader around the screen into the power pads. Keeping away, of course, from the devil which chases you around the screen. Steer with your deflex shields, but beware the mines or you may be buried alive. Superb graphics and fantastic sound on the 48K SPECTRUM only. £4.95 on cassette.

CITY BOMBER A full feature version of the popular game 'BLITZKRIEG' supplied for the 16K or 48K SPECTRUM only. £2.95.

Blast the falling meteors as they invade your planet. Cruise missiles are your only defence in this world of disaster. If they break through the crust of your planet then your life support systems will fail. A very addictive game with fast action and great graphics. Only £2.95.

GRAPHICS CREATOR

NOT just another character editor! This one allows you to define not only the 21 user definable characters, but also allows you to change the entire96 character ASC11 set. Creates BYTES files ready for you to load into your own programs. Includes advanced Reflect, Invert, Field commands etc.
Complete with full documentation. If you are at all serious about SPECTRUM graphics, then bin the BIN statement and use Graphics Creator with its easy on-screen cursor editing. £2.99

YOUR COMPUTER, NOVEMBER 1982

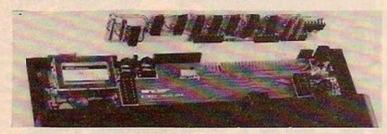

DOWNSWAY

ELECTRONICS (UK) LTD.

MORE MEMORY FOR YOUR ZX81 OR SPECTRUM!

MEM!

32K RAM FOR SPECTRUM

A full 48K of memory for the 16K Spectrum — simple D.I.Y. installation by just undoing 5 screws and plugging in! "State of the art" technology — advanced design using fewer ICs for high performance, reliability and economy.

ONLY £42.50 plus p & p.

MEMORIES FOR THE **ZX81**

The Downsway 64K Memory* slots directly on to the computer, without needing an additional power supply, or adding any extra load to the internal 5v regulator. Trade in your old 16K RAM Pack (any make, any age, any condition) for £12.50 against a Downsway 64K Memory to bring the price down to only £47.45plus p & p. Without trade-in, it costs just £59.95 plus p & p — still incredible value!

If you only want 16K of memory for your ZX81, the Downsway 16K RAM Pack offers the same benefits of high quality and low price at only £24.95 plus p & p.

Both memories measure only 2½ x 1½ x 1in. and are supplied with a foam cushion strip to provide added mechanical stability.

* Reviewed in ZX Computing Aug/Sept 1982 and Popular Computing Weekly 22/7/82.

Naturally Downsway add-on memories are fully tested and guaranteed, but should you be dissatisfied for any reason, just return the memory within 14 days for a full refund (and your old 16K RAM pack, where appropriate).

Please allow up to 28 days for delivery.

To: Downsway Electronics (UK) Ltd Dept. M, Downsway House, Epsom Road, Ashtead, Surrey.

A NEW ERA OF WORD PROCESSING WORD PROCESSING FOR THE VIC

The introduction of Wordcraft 20 for the VIC brings the benefits and advantages of full scale word processing directly to the general public. Until now only the business world could afford word processing systems but this amazing price breakthrough makes it available to everyone. Wordcraft 20 comes on a cartridge ready to plug into the back of the VIC. Included in the cartridge is an extra 8K of RAM that is also available for use with other programs – so not only do you get a word processor but you also get a memory expansion thrown in. The system also comes with complete documentation catering both for the inexperienced user and for those already familiar with Wordcraft 80.

Just look at these features:

- ★ Full use of colour and sound.
- ★ Full compatibility with VIC 1515 printer, parallel printers or RS232C serial printers.
- * Full control over margins, document width, tab

stops, decimal tabs, justified output, multiple copies. Complete control of the final output.

- * Automatic underlining and emboldening.
- ★ Full screen display with automatic paging.
- ★ Full storage and retrieval facilities from disk and tape.
- ★ Full compatibility with Wordcraft 80.
- ★ Name and address capabilities including labels.
- * Full document merging facilities.

Wordcraft 20. The package that the VIC user has been waiting for. A word processor of proven quality at a low price.

For the first time ever, every home can have one.

Wordcraft 20: £125.00 inc. VAT and p&p. Available from all VIC dealers or direct from Audiogenic Ltd. PO Box 88, Reading, Berks. Tel: 0724 586334. Wordcraft 20 is copyright P.L. Dowson 1982.

SPECTRUM 48K: ZX81 16K SIX PART ADVENTURE

ACK CRYST THE QUEST IS ABOUT TO BEGIN

The ultimate rele-playing adventure for the SPECTRUM/ZX81. You can become a warrior, elf or wizard on a quest to find and use the rings of creation: to destroy the Black Crystal and defeat the Lords of Chaos. Held within six programs lies a land of fabulous treasures and mythical monsters. Journey through the land of Beroth, explore the castle of shadows, descend into the Shaggoths lair, search for diamonds in the sea of sand but beware of sand sharks! Confront the fire demon in his temple, battle against the Lords of Chaos and win your way to the Black Crystal. By splitting Black Crystal into six programs we can provide more variety and detail than any other adventure for the Sinclair computers.

computers.

Real time monster battles. Superb graphics. Save game feature.

All six parts are supplied together on cassette, boxed with instruction booklet.

16K or 48K RAM...
full-size movingkey keyboard...
colour and sound...
high-resolution
graphics...

From only £125!

First, there was the world-beating Sinclair ZX80. The first personal computer for under £100.

Then, the ZX81. With up to 16K RAM available, and the ZX Printer. Giving more power and more flexibility. Together, they've sold over 500,000 so far, to make Sinclair world leaders in personal computing. And the ZX81 remains the ideal low-cost introduction to computing.

Now there's the ZX Spectrum! With up to 48K of RAM. A full-size moving-key keyboard. Vivid colour and sound. High-resolution graphics. And a low price that's unrivalled.

Professional powerpersonal computer price!

The ZX Spectrum incorporates all the proven features of the ZX81. But its new 16K BASIC ROM dramatically increases your computing power.

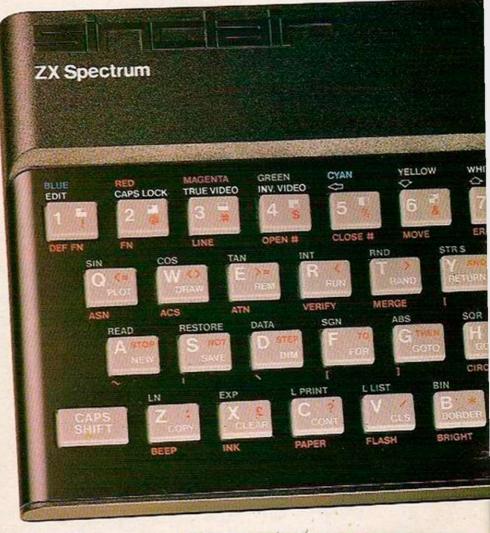

You have access to a range of 8 colours for foreground, background and border, together with a sound generator and high-resolution graphics.

You have the facility to support separate data files.

You have a choice of storage capacities (governed by the amount of RAM). 16K of RAM (which you can uprate later to 48K of RAM) or a massive 48K of RAM.

Yet the price of the Spectrum 16K is an amazing £125! Even the popular 48K version costs only £175!

You may decide to begin with the 16K version. If so, you can still return it later for an upgrade. The cost? Around £60.

Ready to use today, easy to expand tomorrow

Your ZX Spectrum comes with a mains adaptor and all the necessary leads to connect to most cassette recorders and TVs (colour or black and white).

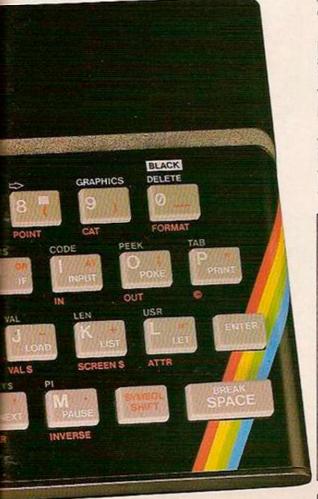

Employing Sinclair BASIC (now used in over 500,000 computers worldwide) the ZX Spectrum comes complete with two manuals which together represent a detailed course in BASIC programming. Whether you're a beginner or a competent programmer, you'll find them both of immense help. Depending on your computer experience, you'll quickly be moving into the colourful world of ZX Spectrum professional-level computing.

There's no need to stop there. The ZX Printer – available now – is fully compatible with the ZX Spectrum. And later this year there will be Microdrives for massive amounts of extra on-line storage, plus an RS232/network interface board.

Key features of the Sinclair ZX Spectrum

- Full colour 8 colours each for foreground, background and border, plus flashing and brightness-intensity control.
- Sound BEEP command with variable pitch and duration.
- Massive RAM-16K or 48K.
- Full-size moving-key keyboard all keys at normal typewriter pitch, with repeat facility on each key.
- High-resolution 256 dots horizontally x 192 vertically, each individually addressable for true highresolution graphics.
- ASCII character set with upper- and lower-case characters.
- Teletext-compatible user software can generate 40 characters per line or other settings.
- High speed LOAD & SAVE 16K in 100 seconds via cassette, with VERIFY & MERGE for programs and separate data files.
- Sinclair 16K extended BASIC incorporating unique 'one-touch' keyword entry, syntax check, and report codes.

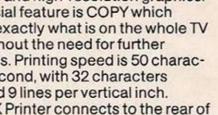

The ZX Printeravailable now

Designed exclusively for use with the Sinclair ZX range of computers, the printer offers ZX Spectrum owners the full ASCII character set - including lower-case characters and high-resolution graphics.

A special feature is COPY which prints out exactly what is on the whole TV screen without the need for further instructions. Printing speed is 50 characters per second, with 32 characters per line and 9 lines per vertical inch.

The ZX Printer connects to the rear of your ZX Spectrum. A roll of paper (65ft long and 4in wide) is supplied, along with full instructions. Further supplies of paper are available in packs of five rolls.

The ZX Microdrive coming soon

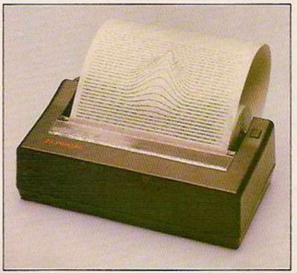

The new Microdrives, designed especially for the ZX Spectrum, are set to change the face of personal computing.

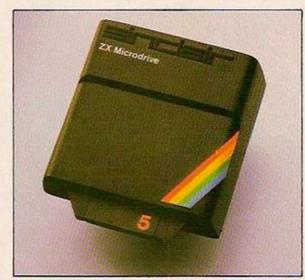

Each Microdrive is capable of holding up to 100K bytes using a single interchangeable microfloppy.

The transfer rate is 16K bytes per second, with average access time of 3.5 seconds. And you'll be able to connect up to 8 ZX Microdrives to your ZX Spectrum.

All the BASIC commands required for the Microdrives are included on the Spectrum.

A remarkable breakthrough at a remarkable price. The Microdrives are available later this year, for around £50.

How to order your ZX Spectrum

BY PHONE-Access, Barclaycard or Trustcard holders can call 01-200 0200 for personal attention 24 hours a day, every day. BY FREEPOST - use the no-stamp needed coupon below. You can pay by cheque, postal order, Barclaycard,

ZX Spectrum software: how good and how soon?

The ZX Spectrum uses an enhanced version of Sinclair BASIC, fast becoming a world standard, and unlikely to be superseded. Unique features, such as one-touch keyword entry and syntax check and report, are increasingly attracting software originators.

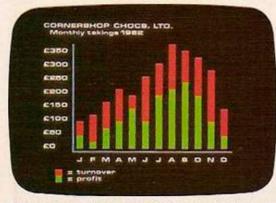

Building the software library is already far advanced, and a complete catalogue will be available in the next few months. Subjects will include sophisticated games, education, 'housekeeping', and business management. The more complex packages can, of course, be used to their best advantage with the full 48K RAM version of the ZX Spectrum.

The Sinclair ZX Spectrum can handle sophisticated games programs with high-resolution colour graphics and sound.

This major advance in computer technology maintains Britain's world-beating position in the field of personal computers.

A range of business software will soon be available, covering both specific applications (eg stock-control and payroll) and general business management systems (eg matrix models).

This second generation of Sinclair personal computers demonstrates continuing commitment. Advanced technology made the ZX80/81 family a price breakthrough: advanced technology makes the ZX Spectrum a breakthrough in price and performance.

Elegant, effective, unique—the ZX Spectrum design.

'Less than half the price of its nearest competitor – and more powerful.'

'These two pictures show how it's done. On the right is the PCB from the BBC Model A Microcomputer. On the left is the PCB from the ZX Spectrum.

'It's obvious at a glance that the design of the Spectrum is more elegant.

What may not be so obvious is that it also provides more power.

'The ZX Spectrum has more usable RAM, and higher maximum RAM.

'It offers twice as many colours on the screen at any one time, plus a colour brightness control. It also offers userdefinable graphics.

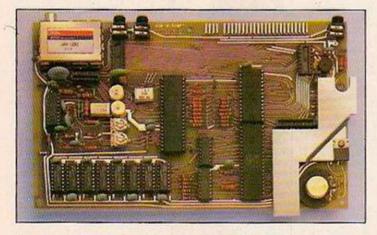

'It has data transfer rate 25% faster,

supported by a VERIFY facility.

'And it employs a dialect of BASIC (Sinclair BASIC) already in use in over 500,000 computers worldwide.

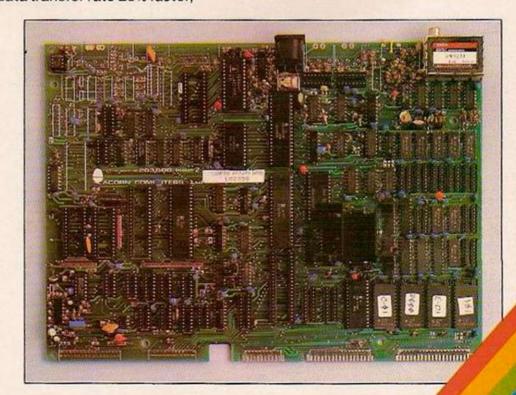

'We believe the BBC make the world's best TV programmes – and that Sinclair make the world's best computers!'

-Clive Sinclair.

Above left: internal layout of Sinclair ZX Spectrum. Right: Internal layout of BBC Micro Model A.

The illustrations are to the same scale, and demonstrate the rate of advance in microcomputer design. The ZX Spectrum uses just 14 chips to provide more power and more user-available RAM.

sinclair ZX Spectrum

Tim Hartnell's previous books have been warmly welcomed by the computer press:

... This is undoubtedly the book to read . . . " Personal Computer World ". . . A book to be recommended . . . "Computing Today

The book you've been waiting for!

This is a book that will allow you to make the most of the ZX Spectrum - a book that will lead to you 'expert programmer' status within weeks.

There are two major sections - the first for those who have no previous experience of computer programming, and the second containing advanced material for really powerful programming. All sections of the book make good use of the full eight colours, sound generation and high-resolution graphics. You're also shown how to make the most of Sinclair BASIC features such as DEF FN, SCREEN\$, MERGE and FLASH.

Key features of 'Programming Your ZX Spectrum'

- Using the colour effectively -BRIGHT, FLASH, INVERSE and
- Sound there's more to the BEEP than meets the ear.
- Finding your way around the keyboard, the use of every keyword, command and function.
- High resolution graphics how to use them for stunning displays, how to create your own version of the famous arcade game 'Pacman' with user-defined graphics.
- The ZX Spectrum has the full ASC11 character set and this book includes a word processor program to make best use of it.
- The Spectrum LOAD and SAVE is highly reliable, and the MERGE and VERIFY features increase its flexibility. Programming Your ZX Spectrum outlines simple ways to ensure you never lose a program.

The ZX Printer

All program listings are dumped direct from the ZX Spectrum, so all programs are guaranteed to run.

The Microdrive

An appendix to this book details the commands needed to use your ZX Spectrum with the Microdrive microfloppy so you'll be ready when it comes on the market.

ZX81 & 16K THE TOMB OF

DRACULAY

Occupying over 13 1/2 K of memory, a superb 3D graphics adventure game for the ZX81 with 16K RAM, for only £3.95! Enter Dracula's tomb at 30 minutes to sunset ... wander through the tomb's pre-mapped 300 vaults in search of the fabled Vampire's Treasure ... pick up valuable silver stakes and use them to defend yourself against the lurking horrors ... ghouls, zombies, pits of primaeval slime ... See them all on the ZX81's plan of the tomb ... when it will let you! Take a chance on a Mystery Vault ... if your dare! And all the time the minutes are ticking by to sunset ... when Dracula rises from his coffin and comes after you! Each of the infinite levels of the tomb has its own 300 vaults ... go as deep as you like, the Prince of Darkness will seek you out in his blood-lust! WARNING: people of an exceptionally nervous disposition should play this game only during the hours of daylight! Special facility enables a game in progress to be saved on tape so you can continue it whenever you choose.

Price of only £3.95 includes ready-to-load cassette with library case and inlay, full instructions, postage and packing. Order today! Money refunded if not delighted! Send cash, P.O. or cheque to:

MOVIEDROME VIDEO (DEPT. YC6) 19 Leighton Avenue, Pinner, HA5 3BW.

SPECIAL OFFER

MICHAEL ORWIN'S ZX81 CASSETTES The best software (by various authors) at low prices.

OUOTES

"Michael Orwin's £5 Cassette Two is very good value. It contains 10 stolid well designed games which work, offer plenty of variety and choice, and are fun."

from the ZX Software review in

Your Computer, May '82 issue.

"I had your Invaders/React cassette ... I was delighted with this first cassette.

P. Rubython, London NW10

'I have been intending to write to you for some days to say how much I enjoy the games on 'Cassette One' which you supplied me with earlier this month.

E. H., London SW4

"I previously bought your Cassette One and consider it to be good value for money!'
Richard Ross-Langley
Managing Director
Mine of Information Ltd.

CASSETTE 1

(eleven 1K programs)

machine code: * React, Invaders, Phantom aliens, Maze of death, Planet lander, Bouncing letters, Bug

I Ching, Mastermind, Robots, Basic Hangman. PLUS Large screen versions of Invaders and Maze of Death, ready for when you get 16K. Cassette One costs £3.80.

CASSETTE 2

Ten games in Basic for 16K ZX81

Cassette Two contains Reversi, Awari, Laser Rases, Word Mastermind, Rectangles, Crash, Bases, Word Mastermind, Rectangles, Cra Roulette, Pontoon, Penny Shoot and Gun Cassette Two costs £5.

CASSETTE 3

8 programs for 16K ZX81

STARSHIP TROJAN

Repair your Starship before disaster strikes. Hazards include asphyxiation, radiation, escaped biological specimens and plunging into a Supernova.

STARTREK This version of the well known space adventure game features variable Klingon mobility, and graphic photon torpedo

tracking.
PRINCESS OF KRAAL An adventure game.
BATTLE Strategy game for 1 to 4 players.
KALABRIASZ World's silliest card game, full

of pointless complicated rules.

CUBE Rubik Cube simulator, with lots of functions including 'Backstep'
SECRET MESSAGES This message coding

program is very txlp qexi jf.

MARTIAN CRICKET A simple but addictive game (totally unlike Earth cricket) in machine code. The speed is variable, and its top speed is very fast. Cassette 3 costs £5.

CASSETTE 4 8 games for 16K ZX81

ZX-SCRAMBLE (machine code)

Bomb and shoot your way through the fortified caves.

GUNFIGHT (machine code)

INVADERS (machine code)

GALAXY INVADERS (machine code) Fleets of swooping and diving alien craft to

SNAKEBITE (machine code) Eat the snake before it eats you. Variable speed (very fast at top speed)

LIFE (machine code) A ZX81 version of the well known game.

3D TIC-TAC-ONE (Basic)
Played on a 4×4×4 board, this is a game for the brain. It is very hard to beat the computer

, of the 8 games are in machine code, because this is much faster than Basic. (Some of these games were previously available from

Cassette 4 costs £5.

Recorded on quality cassettes, sent by first class post, from:

Michael Orwin, 26 Brownlow Rd. Willesden, London NW10 9QL (mail order only please)

ECR 81 DATA RECORDER SAVES AND LOADS YOUR PROGRAMS EVERY TIME!

The ECR81 Enhanced Certified Recorder from MONOLITH is a major advancement in cassette recorder technology which minimises the problems associated with standard audio recorders. The unit is a high reliability program store for ZX computers based on a modified, proven cassette mechanism. The two sections of data recording circuitry automatically ensure precise levels are written onto the tape and that optimised signals are received by the computer.

THE ECR81 IS NOT SUITABLE FOR AUDIO REPRODUCTION NO MANUAL VOLUME OR TONE CONTROL ADJUSTMENT PROVIDED

QCP-FORTH!

- *FULL FIG-79 STANDARD (NON-DISK)
- *FASTER THAN BASIC
- *EASIER THAN MACHINE CODE
- *SUPPORTS ZX-PRINTER

Forth, for those who are not already converts, is perhaps the closest yet to the ultimate all-purpose computer language. It is designed to be fast, portable and extremely flexible. A FORTH program consists, largely, of definitions of new FORTH words, enabling a user to develop a unique, application oriented, vocabulary. It is even possible to alter the syntax to suit your application (or just your style of program!).

*TAPE & DOCUMENTATION . . . £10

GAMES PACKS 1&2

HOME COMPUTER USERS

PRODUCT INFORMATION SERVICE

Do you want the right computer for you? Do you want the right hardware? Or the right software? At the right price? If you're thinking about making a purchase but aren't sure just which product will suit you best why not seek a swift overall picture of what's around from us? Simply let us know what you're interested in and we'll send you a personal summary of what's available: facts, figures, suppliers, details. We'll also enclose as much manufacturers' literature as we can and add whatever related data we think might be worthwhile for you. We'll tell you of any special offers we're aware of, and even help you with your order is you wish. If we don't know how to answer your enquiry we'll try to find out: if we can't we won't take your money. Try us - we're here to help you make the right decision.

SECONDHAND COMPUTER REGISTER

We can also help if you want to buy or sell secondhand. We keep a register of currently available used computers and peripherals and send appropriate details from it to every interested enquirer. This advertisement appears in many computer magazines, which means a lot of people will read it. So, if you're looking for secondhand value write and ask us. If you want to sell, send us full details of what you have to offer and we'll do the rest. Registration costs £4 (or £3 if the total asking price is under £100), and will be maintained until you've sold. Each registration will be acknowledged.

ALL ENQUIRIES COST £1

Please send enquiries/registrations (including cheque/PO) to:

DAVID HEARTFORD

91 High Street, Evesham, Worcs WR11 4DT

SUPPLIERS: If we haven't contacted you please write to us.

50FTWARE

All ZX81 owners can now load/save a full 16K in only 29 seconds with the incredible Qsave hardware/software combination package from PSS.

Just look at these features:

- No hardware modifications are needed
- No extra power supply is needed
- 3. Osave is compatible with your existing tape recorder
- Osave includes a verify feature to ensure successful saving
- 5. No more wasted time waiting for programs to load or save

Most important of all - Qsave is easy to use - simply plug the Osave amplifier/filter unit between your recorder and the ZX81 (all leads are supplied) - Then load the Osave software before you load a tape or key in a program. You can now save and reload a full 16K in only 29 seconds — ie. a data transfer rate of 4000 + baud compared with only 2500 on the standard ZX81.

> Revolutionise your programming now for the all inclusive price of only.....£15.95

Stop Press: 64K version of Qsave now available — £17.95 Please state version when ordering

NORMAL DELIVERY 7-14 DAYS FULL MONEY BACK GUARANTEE

No matter what your needs PSS has got the program for you — From the dedicated Arcade Gamer to the

person looking for an efficient filing system
— you need look no further than PSS—
we have the software you want . . .
STAR PACK Includes 'Maze Drag Race'

quite simply the best arcade game available, and 'Ghost' — an exciting new all machine code action game. We challenge you to find better.

challenge you to find better.

PROGRAMMERS PACK Two programs that take the strain out of programming — 'ZX Compiler' will translate a large subset of the basic commands and 'Enhanced Basic' will handle all your renumbering, block deletion etc in seconds. An absolute must for the programmers among you.

SPACE PACK for the would-be astronaut. Now you can have all the best space games in one package. Includes 'Space Defender', 'Star Trek', 'Alien' and Tailgunner'. Why pay more?

HOME PACK Why not make a real use of your ZX81? With this pack you get 'Autofile', which is a highly versatile and efficient filing system and 'Accounts', which does everything but pay your bills.

which does everything but pay your bills. Ideal programs for use with Osave. Once used you'll wonder how you ever managed before.

All our programs are £4.95 each, £6.95 for two or only £8.50 for any three.

A GOLDEN OPPORTUNITY FROM COMPUTER RENTALS LIMITED

Here at Computer Rentals, we want to see your ZX81 and Spectrum programs. If you have written some software, don't waste it on a small audience of family and friends. Send it to us and we will take a good look at it. If we like it, we'll publish it, leaving you nothing more to do than cash your royalty cheques. Your program can be on any subject: Games, Education, Business, Home Finance . . . if you can think it up we are interested. What's more we don't pay meanly. We want the best and we are willing to pay accordingly. We can offer a royalty of £1.50 for each cassette sold and when you think of the size of the market, you can see how generous we are. Don't be put off before you get your work in the post, just send your cassette away with some instructions and a stamped addressed envelope. After all, you have nothing to lose but the postage, and all to gain from our marketing.

Send to:

Computer Rentals Limited 140 Whitechapel Road London E1.

WHAT PEOPLE ARE SAYING ABOUT OUR . . .

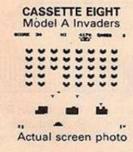

"... I bought all your tapes to date for the BBC Micro and I think they are just super, especially STAR TREK, and the sound effects in CANDY FLOSS really made me sit up! Well done and keep them coming". J. S., Paisley

I was very impressed, not only with the cassette, but also at the speed at which it came! R.L., Cheshire

"... I must congratulate you on your MUTANT INVASION cassette. I have had it for two weeks now and it is really superb. Incidentally, I have beaten your high score of 4,500 — mine is 7,580!"

- S.L., Berks

High resolution graphics:

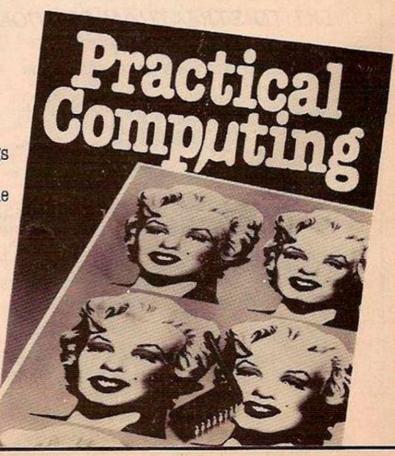

Weputyouin thepicture

This month, we home in on the picture-making aspect of computers - and report on four exciting and intriguing developments: "Bit-stick", the joystick device which brings out the artistic streak in Apple II; Apple II graphics for chemists - a package that draws molecular structures; the BBC micro as a colour graphics terminal, and how to store screen designs as graphic pages within a memory.

Also this month, we report on the Commodore 64 - apowerful computer with graphics facilities - and a new letter-addressing capability of Wordpro...

And that's just a sample of Practical Computing together with advice for users of Pet, Apple, Tandy and Sinclair ZX 80/81 Computers. Buy Britain's leading personal computer magazine.

NOVEMBER ISSUE OUT NOW 80p AT YOUR NEWSAGENT'S - BUT HURRY

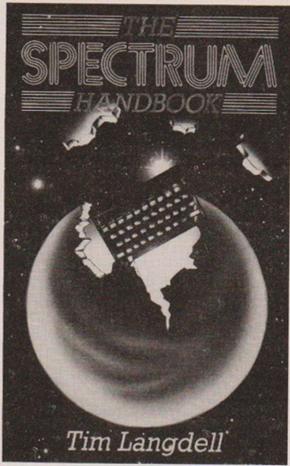

SØFTEK SPECTRUM

MEW! COMPILER

> FOR 48K SPECTRUMS: £8.95 — WITH MANUAL —

Ever wished you could wave a magic wand and turn your BASIC program into a machine code one? Now you can! (well almost). The Compiler allows you to write programs using up to 80% of Spectrum BASIC and then turns it into a machine code version in just seconds. Complete with explanatory manual by Tim Langdell!

Just out from Century/Personal Computer World and available from SOFTEK. Whether you are just beginning or have had some experience with computers, Tim Langdell's book is for you. It covers everything from an introduction to programming, through discussions of graphic art, education, business uses, and games writing to an introduction to machine code and hardware modifications. Packed with programs, routines and many hints and ideas.

METEOROIDS F 4 95

By far the fastest, smoothest version of this arcade game; full colour, three meteoroid sizes, hyperspace, shield, thrust, freeze-frame, mothership, high score, bonus ship at 10000, etc. With ultrasmooth graphics and machine code synthesised sound effect that have left other software houses

wondering how we did it (16K or 48K Spectrums).

Send your cheques or postal orders to SOFTEK, 329 Croxted Road, London SE24.

ADVENTURE

48K 3D MAZENTURE: This fast machine code game is both a 3-D maze and adventure in one. Highly recommended and excellent value for only £4.95. (48K Spectrums only).

16K THE ZOLAN ADVENTURE: A full adventure in 16K: probably the best around — only **£4.95**.

ORDERS TAKEN NOW FOR: The Spectrum's ROM: Most of the ROM disassembled, with hints and tips on using ROM routines; only £5.95

SCREENKIT 1: Add extra facilities to your Spectrum — instant INK and PAPER change, sideways scrolls, several screens, cartoon effects, and much more. Only £5.95

TOOLKIT 1: Essential for the serious programmer — renumber, realtime clock, search-and-replace, TRACE, and more. Only £5.95

WRITERS! why not let us market your software for any computer. We pay the highest royalties and market both from London and our office in Los Angeles.
